The Win32 port of atari800 is DirectX-based.

Interesting. I've been browsing the site, and I see source code in
multiple languages. Some of them are downloadable tokenized .BAS files,
some are links to ASCII source code, etc.

Granted I haven't gone through every (or even most) issue(s) but still,
there is source code available.

What prank? I went to Atariage A8 forum and
couldn't find the '1200XL setup problem' thread.
Those pictures looked real.

RAM was my first thought too. The heat of those two chips bothered me
though.
There was something which I didn't really connect until now. I found a few
tiny balls of solder nearby. I think something is causing the chips to go
into heater mode to the extent they melted some of the solder. Some of
their solder looked a little depleted, but the workmanship on this unit
wasn't so hot anyway.
The question is where the short (or fighting logic I guess) is.
I wish I had written down the actual type of chip that was heating up before
I resealed the unit.
I can tell you that they are the two chips between the row of 8 resistors
and the cartridge slot.

>
> But leave it on over night and reboot in the morning. This sometimes

I'm scared to leave it on for five minutes! But you are right. In a lot of
cases that does seem to help electronics that haven't been used in a long
time.

They should be 64k chips organized as ~16k 4 bits wide. If they still
are then it could have been a botched repair. If they are 256k as 64k X
4 bits chips, there is a chance someone tried to expand it to 64k.
```

For the most part, Antic did not publish assembler source code. (Quite
contrary to Analog, which did.) Antic published mostly BASIC programs.
The BASIC files are there. Most programs that had assembler were
listed as BASIC data statements which when typed and entered became
machine code modules or programs.

A long story short... The driver modules are different. AFAIK, only
Dos XL and SDX provide drivers compatible with the Indus. I have
several Indus, and over the years I've tried to find (and even write)
an Indus driver for MyDos. It was once rumored that SuperDos 5.x would
have a driver, but I don't believe it ever happened. -Larry

Good game for sure! I played it recently on the Atariage game contest. I almost reached the end. Don't you fight this big boss jumpy thing at the end of the map? How do you beat it if so?

FamilyNet International Newsgate

Hi! I record Atari sequences, but the way I do it (just to chime in for possible inspiration) is using a G4 Mac and EyeTV video capture module. I have an Atari 800 with the More than Games Break out video Box (which allows you to use standard A/V cables.) I have a Y-adaptor so that the Atari 800 displays in real time on the A/V monitor, and buffered time on the EyeTV.

The resulting videos are sent to YouTube. So go to YouTube, do a search for doctorclu, and you'll find my Jaguar, Atari 800, and Atari ST videos.

Currently showing... Star Raiders:The Commander Mission. :)

I also have a generic Indus driver on my to-do list. The problem is that
the Indus has a Z80 CPU internally, and the driver will load a Z80 binary
program into the Indus, and I'm not very good in Z80 assembly.

The SDX 4.40 team from Poland might have the SDX source for the Indus.SYS
Driver. With the source it would be much easier to write a generic driver.

The Thread has been renamed to "The 1450XLD fake thread"
http://www.atariage.com/forums/index.php?showtopic=99557

There are a lot of pictures and a "makeing of a working fake 1450XLD..."

Source record: 5302

Well, nothing like December and that Christmas cheer, eh? Here is the list of our winners for this month:

1. 3 month subscription to ST Magazine - Callaghan!

2. Mega STe motherboard - Doc Clu!

3. Guderian (8bit game) - Jelle!

Next months prizes include the following:

1. 3 month subscription to ST Magazine

2. (another) Mega STe motherboard!

Congratulations to our winners, and good luck to all those who call this month! :)

PS I'd better explain Doc Clu's winning strategy - he was the only one who registed more than once for his prize - in fact, he registered multiple times. The program I use to pick winners randomly picks from a list - a caller is obviously going to have better chances the more their name appears on that list. So the more you call and register.... :D

I still have my Atari 8-bit TrackBall new in original box with
small manual. I have never used it.

There is a switch for TB (trackball) or JS (joystick)

The manual mentions Missile Command and states
that if you switch to TB when playing missile command,
that you must type (CONTROL) T on your keyboard
before starting the game. And reset if you have
problems and try again.
Also, you cannot skip waves when playing Missile
Command with the setting set to TB.

Seems I recall this track ball works on a ST as well,
but not sure on that.

I think that the Imagination Station for the 8-bit works
on the ST as well. I still have this, but is used.

Message-ID: <5fGmh.18058$AY1.12542@bignews5.bellsouth.net>
Source record: 5306

Greetings,

Looking for some original Atari 8-bit
software titles.

Mostly WWII related games.
Crusade in Europe by Microprose.
Decision in the Desert

Most all WWII games by SSI such as
Operation Market Garden

I need original Manuals and Disks. Boxes aren't
necessary but would like to have those too.

If you have any for sale/trade, contact me at:

phantomm@bellsouth.net

If these can still be bought new, someone let me
know.

I still have to get an Atari Flashback of course.

I already read up on the Nintendo on a chip and made a post or two about it. I haven't purchased one of the hackable ones yet I may never buy one since I am not really interested in the NES but...

I was going through a local store and they managed to separate me from ~$35 for two of the hand held with RCA cable that have video and audio out. One was a 75 in One GameGEAR and the other was an Intellivision clone with 10 games.

Has anyone hacked one of these puppies? I know everything I would need to know about hacking a cartridge port into the NIAC and Flashback but am looking for technical specs like pinout and memory map. I couldn't find anything worthwhile with google.

I'm kind of assuming the GameGEAR is NES based but it has a epoxy glob with DIL 44 pin SO type main chip. I haven't looked into the Intellivision yet. I'm assuming fewer pin out version of NIAC because they have a 21.xxxx mHz clock chip like is used in the NES clones.

I emailed the manufacturer asking to buy a developer pack and got my usual 'non response.'

Gamegear was a Sega Mastersystem. Z80 based system.

http://en.wikipedia.org/wiki/Sega_Game_Gear

Shit, Breen - with your head stuffed so far up PT's ass, why don't you
just remove it and ask him yourself?

Or are you just one of his multiple personalities... I see you follow
him wherever he goes.

And why post this message to the comp.sys.* groups? I'm sure you have
his email? Just trying to stir up more interest in your (his) stuff?

There aren't many hacks for the Flashback. The Flashback 2 has tons of mods/hacks and is a real 2600 on a chip, so you might want to look into that.

My STs are in storage but I was wondering if anyone ever hacked a MS
style mouse to work with an ST.

Seems like all you would have to do is take the signal between the
choppers and PIC out to the ST mouse port.

Rick

38. FS: Various ICs - Speech Synthesizers, Sound Generators & More

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-04 22:24:51 UTC
From: Keinert <keinert@sbceo.org>
Message-ID: <1167949491.268518.200050@s34g2000cwa.googlegroups.com>
Source record: 5321

Hello fellow Atari enthusiasts,
In an effort to increase my inventory of IC chips used during repairs,
I have made a bulk purchase of integrated circuits. All parts are new
old stock and are guaranteed working. I have anywhere from ten to fifty
pieces of each part number listed below:

SC-01-A
AY-3-8910 (or AY38910)
AY-3-8912 (or AY38912)
DAC80-CBI-V
IDT6116 (or CY7C128A)
HC-55516
MC3417L
SN76477
SP0250 (or SPO250)
SP1000
TMS5200
TMS5220

All parts and prices are listed on my website at www.keinert.com
As an introductory offer for the month of Jan. 2007, let me know that
you saw this post in this newsgroup and take 5% off any order of
$100.00 or less (before shipping). Orders over $100.00 get the 5%
discount and free shipping in the USA.

These parts are limited to my stock-on-hand. I am not getting into the
IC parts business, nor do I intend to become a serious competitor to
the other parts suppliers who post on this newsgroup. I made a bulk
purchase of IC parts in order to fill-in my inventory. I bought more
than I needed so that the cost per IC would be reasonable. The extras
are being sold on my website.

Thanks and Happy New Year!
Kevin Keinert
www.keinert.com

DOH! I had another senior moment: I should have typed DreamGEAR.

BTW: Just bought another one for $16 or so. This was a 50 in one and I think I can see a flash chip vs. an epoxy glob in this one.

I know the chances of talking them into doing something like 65802 and bringing the lines out is nil, but still drawn like a moth to flame. I mean just doing simple stuff like flashing it with patched Atari OS for the NES video would be a start.

Lol, I know how you feel Rick. I have had to curb my enthusiasm with
these all in one units. I have in the lounge a Media PC, Xbox, Dreamcast
(can be used for 2600 emulation;-), N64 and a Jaguar, the kids room has
a Genesis, CD32 and N64. I also have a box in the study with a 2600JR,
2600DV, Playstation :-p, Saturn and SNES. If I bought any more home the
wife might go spare;-) I have around 15 Atari computers too, so I am
treading on thin ice, grin.

Mark

Hello,

It's been quite a while since I've been into Atari 8-bits. I'm glad people are keeping it alive though. Thing for me is though, I have tons of equipment laying around that I will probably won't ever get back into. I haven't checked my inventory, but I'm pretty sure I have at least 2-3 800XLs, 2-3 130XEs - some with upgraded ram, a couple of ICD MIOs, a Black Box, probably 4-5 1050s, a couple Indus GTs, I think a few 300/1200/2400 baud modems, a couple of printers, etc. I think I even have an original copy of Carina BBS, or at least I did.

I'm wondering if people would be interested in this or if the old 8-bitters are doing something else now - meaning emulators, etc? I'm not looking to buff and shine my stuff and ebay it. I'd much prefer to put it in hands of someone that would make good use of it. In fact, some of my stuff is apart - which, of course I would assemble if requested - but any soldering/modifications I've made in the past are solid.

Anyhow, would anyone here be interested? If there's not a real market, I will just keep it until I have time and inclination to delve back into it. Also, I'm not interested in selling individual components or parts. I'm more interested in having my stuff in the hands of someone that has the time and dedication to Atari 8-bit.

Best regards,
DM Hebert

I'm actually a little bit more optimistic with this one. They have a SOL
6256 CMOS 8K X 8 RAM and the flash chip appears to start ~M5M29F? which
should be a standard manufacturer type like Mitsubishi where I can get
data sheets. Looks like the things in the epoxy glob are sound, video,
```

and processor. => at least 16K worth of address lines are brought out
and the data lines will be obvious.

It is probably outside the limit of my abilities but I would like to see
if I can hack it a bit. I mean I should just go buy a palm pilot or
something but it's a hobby I guess. This would be *SO MUCH EASIER* if
they just said ~"Send us $200 for a developer package."

I'm not really a fan of the NES graphics. I'll ack 16 colors in 256X240
rez is better then 4 colors in 160X224. I used my Atari for everything
from home control to modeming mostly where 40 column text beats 32. If I
can get something programable in 6502 asm with 1 bit of I/O I will be happy.

Rick

Have now, thanks. Seems a bit pricey at ~$40 but I guess switching to an optical mouse would be worth it.

Got one when they first came out - works a treat, plug 'n play, totally
transparent to the user.

PS Not one this month, but check occasionally with my BBS - we gave 1 away
not too long ago as one of our monthly prizes. :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

On Wed, 3 Jan 2007 at 22:13 -0500, Jack Tseng scribbled:
->Indus RAM Charger CP/M Boot disk cant boot in my Indus GT... Anyone
->explains how to do that?

1) Does a regular boot disk (i.e., some other version of DOS) work
in that same drive? (Just to make sure the drive works.)

2) Is the extra 64K memory board installed in that drive? An
"ordinary" Indus (without it) won't run the CP/M program.

The standard Black Box was sold without a casing. CSS did offer a
plastic casing for it (black, of course) for an additional fee. Bob
told me once that it cost a fortune to have the cases moulded, and that
he actually made no money whatsoever selling them.

Thats really not that much, I mean, a _1400XL_. Snipers suck but hey, better bid what your willing to pay up front, and let the snipers take a chance.

Has this machine changed hands much? I mean is this a known 1400xl in the community?

I've got an Atari PC-1 that I think pretty sweet...

Charlie

Got it from a guy in Germany, think he's a frequent poster. Did not work,
sadly, but he said that it was sold as is. Don't know if it's worth the
effort to try to repair it, nobody here in Norway is capable I think.

Take Atarian care

I seem to recall quite a few 1400XLs made it out, probably dozens. I
think B&C sold them about the time Atari was having warehouse sales
circa the late 1980s.

The B&C price was nothing like $3000 of course. I think maybe around
$150 or so.

I take everything I see on eBay with a grain of salt. I have seen sales
where the feedback was entered within hours of the auction close. Just
no way the item to be paid for, shipped, and received in the time available.

Apparently cheaters do this for several reasons. They inflate the price
for people that use the 'completed items' to check what stuff sells for

and they effectively keep merchandise that they don't want to let go below a certain price point rather then use the official eBay reserve price option.

They could even be drawing people out of the woodwork. For example someone seeing that $3,000 price may search through their closet for their old Atari stuff and put it up for auction.

Rick

There was 'Adventurous Programming' in
ANALOG (about 39,40,41) for creating
text adventures, by Clayton Walnum.

I thought that the 1400XL was even sold commerically for awhile, but it
turned out to be a bit flakey, so people were returning them and stores
started just throwing them in the garbage. People were grabbing them out
of the garbage and returning them again, so the stores started taking the
silver name strip off the front (explaining why most of the ones you see
are missing it.)

Any truth to that I wonder?

The 1450XL just saw light of day as engineering prototypes that some atari
employees got (IIRC)

How do they get out of paying the final value fee on that? Or do they just
pay it, as a part of doing business ?

There were several.

There was also the Adventure Creator cartridge (by Spinaker IIRC).

The Codeworks product was called "The Adventure Master" -- fairly hard
to find.

Unfortunately, the "Adventure Construction Set" was never ported to the
A8.

I don't recall "The Slave" -- do you have any further info about it?

-Larry

It cost $5 insertion fee and maybe $65 final value
fee. About $70 to sell $3090, plus shipping, which
the buyer pays anyway. About 2.5%
Many sellers charge shipping and handling, which
covers the selling fees, and doesn't get added to
the final value fee. This auction was for actual
shipping cost, however.
I don't think the seller would claim non-paying buyer.
That would involve somehow trying to say the
buyer didn't pay, if payed with PayPal or credit
card, there's proof it was paid.

Hi,
Sorry, I know it is not A8, but I need to ask a bit of a newbie question
relating to the 2600.
Simple enough - do NTSC games work on a PAL console?
Cheers,
Paul

What I think happens in some cases, not necessarily this one, is the
seller *is* the buyer with just another eBay ID/computer. He just never
clicks the paypal button to pay himself and claims buyer never contacted
him or sent payment.

The cartriges are interchangeable. I've used PAL carts on my NTSC 2600
no problem, but you will have issues with how the game displays on the
TV. I could not get the vert hold to sync with PAL cartridges.

And I think there's issues with color. Superman was not having the right colors on his outfit. Smurfs are green or something, don't remember, but wrong all the same.

It was marketed by CBS if the screen shots I have are correct.
The title screen says "by Christopher Chance" and "(C) 1984".

> Unfortunately, the "Adventure Construction Set" was never ported

Yes I forgot about colours. I rem Popeye (PAL) was coming out black
and white on my NTSC 2600.

I would stick to NTSC games on NTSC 2600 and PAL on PAL to avoid
headaches.

99. <atari> MyDOS on a Cartridge

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-13 02:34:09 UTC
From: "comp.sys.atari.8bit" <atari@rtdos.com>
Message-ID: <mailman.29.1168655674.13908.atari_rtdos.com@rtdos.com>

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

http://www.rtdos.com (wiki)

http://rtdos.com/mailman/listinfo (email lists with mail2news gateway)

school just started so i'll need help adding content to the wiki; my goal is create an encyclopedia of retro gaming console and retro pc knowledge (esp. programming) but from a joint community effort (hence, the wiki); because the retropedia can be used as a portal, i've added chat, message boards, the ability to check email and newsgroups (nntp) messages as well as personal journals (blogs), etc.

hopefully this addition to the retro community will benefit all users of all systems; i'm still learning the ropes of hosting a wiki (and managing the tiki) so any and all suggestions, comments, and even criticisms are welcome.

That seems impossible. The ST had midi ports, the A8 didn't. How can you have a midi player without a midi port? Unless you're asking if there was a program that could decode a midi file and play it with the A8 sound chip. Very few midi files are monophonic, or even quadriphonic, but multi-timbral and multi-phonic, many instruments, many voices.
There were a few music formats for A8, probably the AMS files the most common. An AMS file could play four voices, but only one patch or sound. There were also some programs that could do digitized sound, like Parrot, but it was pretty poor sampling rates, like 8K or so.

I'm a little ignorant about midi: Isn't it just 38 kBAUD serial data
similar to SIO?

There's a lot of stuff I don't know like does it have to be 2 way
communication?

Nah, but if you want to play around I would get a MidiMAX. I just got one from Best Electronics last Friday. I've been playing with it all weekend. I've got it hooked up to a Roland MT-32. Sounds great for a cheap little synth being driven by an Atari 8 bit!. I've never done any MIDI what so ever, I'm not even a musician, and I've been able to get some sounds goin! I've been converting AMS music files to play on the Midi Music System software. The same programmer wrote both "Midi Music System" and AMS, Lee Actor! And he wrote a utility to convert AMS -> MMS !

Man, the AMS was a great system that really showed off the 8 bit; wasn't
there a SID hack to add the SID chip to the 8 bit ?

Right, midi is a serial data, I think 38K baud is correct. It doesn't have
to be two way communication, but customarily has a midi in and a midi out
port, two cables, one for recording, one for playback. MIDI has its' own
protocol, most data is note on, duration to play (note off), sorta like
printer codes. MIDI also has pitch bend, patch selection (127 standard
'instruments'). A cheap MIDI keyboard will have 16 'voices' at one time,
and 8 or more instruments (patches). Some MIDI instruments have 'system'
codes, that will allow adding your own patches.
```

But didn't the Amiga (or later ST/TT's) have a midi through port ?

And were the midi ports (or can they) be used for other than midi ?

I think you may be right, some ST/TTs had a midi thru port.
I'm sure midi ports can be used for other things, especially if Rick Cortese
gets hold of one, but I've never heard of it.

OK!

Sounds like you could send the info through a joystick port. I did a
reverse hack of an MMP modem and got a J/S cable to work as an RS323
port with the MMP software.

I also did some ML/BASIC code for blind sending files for transfer to a
RS2323 interface like an IBM or ST. I know I got it up to 19k send.
Pretty sure I could have got it faster if I needed to. No handshaking of
course so it would probably over run a Midi instrument buffer without
something to pace it.

Makes me wonder if MidiMate was just an RVerter type device with POKEY set up for 38k BAUD. If that is right, you should be able to just make an adapter from a SIO2PC cable and run it with the MidiMate software.

Rick

I didn't know Roland made any 'cheap little synths'. I remember playing
with MIDI programming
in Microsoft QuickBASIC 4. I was able to get the computer to play some
notes sending out to
my CASIO CTK 711EX synth. I was trying to be able to send new patch info.
My first experience with MIDI was with the ST and Dr. T's MIDI software to a
Casio CZ-100
keyboard. I believe it played up to four notes at a time, polytimbral (4
patches) or 8 notes,
monotimbral. There are probably 100s of thousands of good MIDI files, just
about any
tune ever written, sung or played.

I seem to remember that there was some kind of semi-automatic creation
system by Databecker (in German) that was part of the book "How to
write Adventure Games" (approximately translated). I've read this book,
but I don't think I have a copy left. It was all based on BASIC.

So long,
Thomas

Some games used it for multiplayer use e.g. MIDI Maze.

I wasn't knocking the MT-32, I actually 'researched' it a bit before I bought one. I looked for a mid 80's, (contemporary to the 8-bit, plus I like the 80's synth sound) simple but capable, standard MIDI device. I meant cheap as just that, $50 bucks off ebay...I'm having a blast so far. Actually the documentation mentions the sample songs were intended to be played on a Casio with 4 voices, the AMS songs match up nicely for something like that.

Yesss....

But then again, Adventure Construction Set was inspired by Ultima I
anyway.

BTW, I loved ACS when it was published. Not only played the levels that
were submitted for Antic's contest but also made my own based on Zelda.
;)

Rats, Miditrack III requires a 130XE. Miditrack II would work on my XL
though. So anyway, I'm still on the lookout for version II.

Charlie

132. More about adventure games

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-17 13:45:49 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <1169041549.589184.274080@51g2000cwl.googlegroups.com>
Source record: 5265

I was interesting reading about the adventure creator utility
in a thread created recently.

My first reaction is that this is about programming of
text adventures with or without static graphics images
illustrating locations in the game.

The images from a game made with adventure creator program
that there was an Antic article about, look like something
in between a real time role playing game and a text
adventure. There is a section for text input on the lower
end of the screen.

I should know after having followed the scene of 1980s
home computing and video games, but honestly I don't: What
is the best way of dividing the adventure genre into
categories?

Text adventures ("Adventureland")
Text adventures with graphics ("Red Moon" and others)

What does "Alternate Reality" count as?

Did "Leisure Suit Larry" have text input? I think it had.

Anders

Hi all. I went to the parts store today and got everything I need for
the Clearpic 2002 but the '68pf' .

Can someone please reccomend a vendor, and possibly a part number,
where I can order online?

Thanks,
Charlie

> Text adventures ("Adventureland")
Well, this was also released as S.A.G.A., so it's also a graphic adventure.
Infocom is purely text based (well, there's a couple PC ones with graphics,
but not on Atari 8-bit)

> Text adventures with graphics ("Red Moon" and others)
Yes, as well as the S.A.G.A.'s, Level 9 had several. Also, The Pawn, Jinxter
and more

> What does "Alternate Reality" count as?
I'd put that under Role Playing Game (RPG)

> Did "Leisure Suit Larry" have text input? I think it had.
Yes, the early ones did, then they changed to point and click. Softporn
Adventure is really Leisure Suit Larry and with text only.

I have been restrictive with letting my four years old
son play computer games. Tonight however, we
played Gateway to Apshai on a 600XL together.

It is quite difficult for a child to handle the Atari,
Wico et cetera joysticks compared with the game
controllers that became popular later.

Anyway, he found it exciting to locate hidden
traps and hidden doors.

I let him look while I played first. The next step was
to delegate the responsibility for pushing the
joystick button for attacks with the sword. You
should have seen the worried look upon his face
each time we were about to enter a new room.
What would wait for us in there? A rat? A bat?
Ghouls? Spiders?

Great game!

The stupid TV changes screen format when
the game toggles between contents/no contents
in the text status line below the moving graphics.

143. MI5 Persecution: Dirk Gently on the Toronto Case (130)

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-18 22:09:31 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07001823035413@4ax.com>
Source record: 5276
Cross-posted to: de.etc.schreiben.lyrik,tw.bbs.literal.lyrics,comp.sys.atari.8bit,fr.comp.sys.mac.materiel,sfnet.keskustelu.politiikka

Dirk was on the West Coast when he got the call. An old friend at the Toronto police department thought he would like to fly up and take a look at a homicide which had occurred the previous evening. He decided to skip the last day at the World Holistics conference and take the next plane out of San Francisco.

The flight was bad; Dirk had been hit on the back of the head by the Newspaper trolley, the drinks trolley, the dinner trolley and now the gift trolley. When the hostesses weren't trying to tear his arm off they pestered him to stop leaning into the aisle - ignoring the fact that the guy next to him was taking up one and a half seats. Air Canada used to be the flight which was so good you just didn't wanna get off - on this occasion Dirk would be glad to see the back of the plane and the over sized alternative comedian wedged into the window seat.

After breathing in a couple of lungfulls of crisp Canadian air Dirk took a taxi into town. There was a small group of demonstrators outside the MacDonalds and the taxi driver insisted on stopping on the opposite side of the street. "Don't Eat Meat" the placards read and the demonstrators chanted. A couple of policemen where stopping the crowd entering the restaurant itself - one held up his arm and challenged Dirk. A wave of the fax he had been sent and the policeman pushed open the door.

There were few customers in the restaurant. Not surprising really with a demonstration going on outside, half the dining area roped off with tape and a dead body seated at one of the tables. "Mr Gently sir" the officer in charge called out as he peeled one end of the tape off a column "We were told not to touch anything til" you got here".

The body of the man slumped awkwardly in a chair. Then even a dead body would start getting uncomfortable in a MacDonalds chair after twenty minutes - and this one had been there for at least eighteen hours. Two back legs and the tail of a cat hung out of the man's gaping mouth. Dirk turned to the officer, "I suppose you are going to tell me this is the darndest thing you ever saw?"

"Ain't this the darnd...". The officer seemed annoyed that Dirk had second guessed him. "We're removing the body in a few

minutes, so if you can get through as quick as possible&#65533;

&#65533;Many people eat cats in fast food restaurants?&#65533; Dirk asked and without waiting for an answer leant over the table to pick up an untouched burger. &#65533;And what&#65533;s this?&#65533; he asked waving it in front of the officers face.

&#65533;It&#65533;s a Vedgie Burger&#65533; The waitress, who was cleaning one of the adjacent tables, shouted across. She walked over to Dirk. &#65533;We started doing them because of that lot out there&#65533; she nodded towards the protesters who were pressing there faces against the windows &#65533;They&#65533;re called Linda McCartney Vedgie burgers - ever heard of them?&#65533;

Dirk suddenly felt faint, perhaps a combination of hunger and jet lag. &#65533;This is deja vu all over again&#65533; he thought to himself. He glanced at policemen - at the badge on his shoulder &#65533;OPD&#65533; but this wasn&#65533;t Ontario this was Toronto. OPD - Officially Pronounced Dead. It dawned on Dirk what was happening, he knew what he would see if he looked out of the window. Sure enough, there it was, the Volkswagen Beetle parked across the road - number plate 28IF - 28 IF Paul McCartney had lived. And amongst the lyrics of the song blaring out into the restaurant he could pick out the words &#65533;I buried Paul&#65533;. Now it was though Dirk was viewing the whole scene though a TV screen. This was conspiracy. Not -a- conspiracy, or -the-conspiracy, but just plain conspiracy.

&#65533;You look faint - are you OK mister? The waitress asked.

Dirk shook his head &#65533;Probably a bit hungry&#65533; Then to economise on dialogue took out a pack of cigarettes and held it out towards the girl. She was about to take one but Dirk snatched the pack away, held it up to his mouth and drew out two cigarettes. He lit both then passed one of them to the girl. It was the closest he had come to a sexual encounter in three months.

&#65533;Want a Burger?&#65533; the waitress asked.

Dirk looked down at the Vedgie Burger on the table. &#65533;No thanks - just a plate of fries&#65533;

The waitress walked away and Dirk looked around the room. Apart from a family seated in the far corner there was only one other person in the restaurant - and he wasn&#65533;t eating. The guy was about mid twenties and had straggling, shoulder length hair. On the table in front of him were lots of pieces of paper cut into squares. Every so often he would pick up a camcorder and pan it around the room and then, when he was finished, speak into a microphone which was attached to a tape recorder. Dirk walked over to where the man was sitting.

The small pieces of paper had paragraphs of text written on them and were stuck to the top of table with blobs of mustard. Lines had been drawn, some solid some dotted, on the table top with a marker pen. The lines ran from one piece of paper to another.

"What are the lines for?" Dirk asked, realising straight away that "What the hell are you doing?" would be more appropriate.

"You see" The man replied nervously "The dotted lines are weak links and the solid lines are strong links. The dotted lines are things which are happening in the rest of the world and the solid lines are things which are happening to me. Now you see I draw over a dotted line, replacing it with a solid line, when I can link something back to me. Like this" The pen squeaked over the Formica and before Dirk could interrupt the man added. "You see I lost my short term memory and, as a consequence have a very short attention span. I write down, record and film everything then put it all together later"

"So" Dirk interrupted. "You filmed what happened here?"

"Yes, yes, it"s here on this tape" The man pushed the cassette across the table. On the label the words "Grassy Knoll" had been crossed through and replaced with "MacDonalds".

Suddenly the man sprung from his seat. Dirk turned and saw that the body was being removed on a stretcher. As it passed the man picked a small object off the edge of the stretcher itself. "This is important" he said, laying a blood stained bullet on one of the small pieces of paper on the table.

Suddenly the room was filled with a deafening throbbing sound as a Black Helicopter landed in the street outside. Two men in United Nations uniforms got out and collected the stretcher. Back at the table the long haired man was replacing all the dotted lines with solid ones. Dirk panicked and began to walk backwards at some speed. Barging through the swing doors he stumbled into the kitchen, tripped and felt himself sink slowly into a large vat.

"The guys fallen into the batter" Dick heard someone shout before he sunk below the surface. He came to sitting in a chair with the batter solidifying all over his body. He surveyed the room through two eye-holes someone had cut. Suddenly the chair on which he was sitting was picked up carried through the restaurant and out of the building. As the chair was being lifted and put into the back of a van, Dirk caught a glimpse of the waitress following him. "Your fries mister, your plate o..."

The doors of the van shut and Dirk tried desperately to steady himself as it sped across town. Eventually the doors flew open and Dirk was flung into the road at which point the solidified batter shattered and set him free. Standing up he found himself outside the international departures terminal of Toronto airport.

In the departure lounge Dirk had time to reflect on the day's events. He had got caught up in the conspiracy theories and the haphazard welding together of pieces of irrelevant information. It was time to catch the person who was operating the bizarre cognitive engine which appeared in front of him like a fairground mirror, distorting any flaw it could find in his own, fragile, map of the real world.

Dirk leant into the aisle of the plane as it took off for London. The oversized person next to him swung his arms violently as he complained about every thing from the supper in a plastic tray to the state of British politics. With a shaven head and a badly fitting suit the man looked as though he could have worked behind the reception desk of the Kremlin. However when he spoke he did so in a Liverpudlian accent. "Me I blame the Con-serv-a-tive government, me. The Tour-rees. That-cher. Me. They need a good kicking" He jerked his feet forward and struck the seat in front with his Doc Martins. "With these. Me Doc Martins. Doctor Martin's, Doctor Martin's, Doctor Martin's Booots!" The phrase was now being sung over and over again as the man writhed in his seat and clicked his fingers.

Dirk looked down at the boots and thought of the reaction most people used to deal with the paranoids at the end of the wire. A nice quick kick. "Oi nutter - get some therapy". This is the easy way out and perhaps the safest. After all there you are sat, alone, in front of the screen. No body language between you some paranoid. No way of telling if he really is some gibbering psycho. Look at it too long and you be drawn in. Fall into the tangled database of weird links with him. Who knows he may be watching you, reassembling and linking your experiences with his. How sure are you of you own cognitive threads. After all cognition is only a bug fix for a neurological system which was designed in a hurry - it's abused by everyone from politicians to advertisers. If people really can convince each other that a bottle of washing up liquid is as exciting as an orgasm using just television God knows what they can do with a computer. Better to avoid the risk. A swift kick. After all if you're Homophobic you put the boot in because you are scared of any ambiguity in your own sexuality - why not be Nutterphobic as well.

Although Dirk would have liked to devoted time to tracking the culprit down he decided to let it rest. The Internet changed over the next twenty odd years. A lot of the people who used it went out and got lives. And those who already had lives burnt them away. The number of users had dwindled after someone had invented a C++ program, with truth as a variable, to deal handle politics and government. Dirk had already retired from finding old ladies cats with the help of obscure science when he got another call from Toronto.

It was 4th March 2025 when he booked onto the Air Canada flight from Heathrow. The silver haired woman in the seat next to him painted bright red lipstick around her mouth. "Of course it was no surprise to be offered the job after Claire Raynor retired" she sneered" After all I used to be a psychiatric nurse... Now if Blokes had periods they would understand..."

By chance the taxi ride to Toronto mental hospital took him past the MacDonalds - where the whole thing had started. Of course it was barely recognisable having become a Church Of Scientology Vedgie Bar. Police in riot gear kept the two sets of demonstrators apart. Dirk didn"t really know what to expect when he got to the hospital. The girl at the reception desk directed him to a row of chairs in a wide well lit corridor. There was a strong smell of disinfectant, the furniture and the carpets were immaculately clean and behind the rows of teak veneer doors the "nutters" were all safely locked away. For some reason Dirk started thinking about CompuServe forums.

A tall blond woman in a white coat approached. "Mr Gentle, I assume"

"Yes" Dirk replied shaking her by the hand. "You"re the nurse who..."

"Doctor" She interrupted, "Doctor Killfile" She led Dirk across the corridor towards one of the doors then stopped with her hand resting on the handle. "Now you know about this person don"t you?" and after Dirk nodded she continued "Don"t tell him anything about yourself - don"t let him get into you head. If he does he"ll screw it up"

The door opened to reveal a frail man sitting in from of a TV screen. He had a keyboard on his lap and next to the television was a computer screen. Dirk glanced at the walls of the room and remembered that his settee at home need upholstering. The nurse left the room and the man looked up "So you come to my daughters wedding and ask me to kill a man" he said in a dry cackling voice. "Look" he continued, pointing at the screen, "I know that man. They"re talking about me now -

listen&#65533;. The man stared at Dirk. &#65533;What&#65533;s your name? Are you one of my friends from the Internet? - Are the lambs still screaming Dirk?&#65533;

Dirk, at first recoiled in horror, then felt a sense of anti climax. So this is what they hyped up to superstar status on the back of their own fears of madness. Dirk was reminded of the film &#65533;A day on The Beach&#65533; where a submarine had set off to search a post nuclear World to track down a signal coming from a remote military base - only to find it was being sent by a Coke bottle half balanced on a Morse tapper. Outside the room the nurse waited for him. Because his nicotine craving had returned - and to avoid an awkward piece of dialogue - Dirk turned to her and asked . &#65533;Patch?&#65533;

Dirk took two nicotine patches from his wallet the first of which he stuck onto the inside of his arm. Stepping closer to Doctor Killfile he opened her white coat and slid his hand into the opening at the front of her dress. He pressed the patch onto her leg as close to the top of her inner thigh as he dare. She took a deep breath and then slowly breathed out. &#65533;What Bogart could have done with these things&#65533; Dirk thought to himself.

&#65533;Is he crazy?&#65533; Dirk asked tilting his head back to towards the door.

&#65533;Who knows&#65533; Doctor Killfile replied &#65533;We let him type away. He sees something on the TV in the morning and it keeps him busy all day. What he types doesn&#65533;t go anywhere it just stays on a mainframe in the basement. It can be read by anyone else in the building but that&#65533;s it. We got them all in here conspiracy theorists, racists, nationalists. They&#65533;ve created a world within a world really...&#65533; Her voice trailed away and she stared down the corridor for a while then added &#65533;So long are two things are different neither will come to be in the other and so become at once both one and two.&#65533;

Dirk gave her a puzzled look &#65533;You mean their brains are fried?&#65533;

&#65533;Fried?&#65533; Killfile smiled at Dirk &#65533;No that was Plato&#65533;. Then the smile fell from her face. &#65533;You must remember, mister, plate o...&#65533;

Mike Corley FAQ
version 0.1
first edition 5th May 1996
last updated 5th May 1996
Iain L M Hotchkies iain@XXXXX.demon.co.uk

Mike Corley is a 'net personality' who has been active on the following
newsgroups (uk.misc,uk.legal,uk.politics,uk.media,soc.culture.british)
since....? Well, at least as far back as the summer of 1995.

He posts long tracts, the tone of which approximates that which one
might expect from a reasonably intelligent paranoid schizophrenic.

No details are known of Mike's 'real' personal life or background.
Once would presume that he came from a reasonable family and was
reasonably well educated before the first symptoms of schizophrenia
began.

Schizophrenia: Clinical features
(from the Oxford Textbook of Psychiatry, 2nd Edition)

The acute syndrome

Some of the main clinical features are illustrated by a short
description of a patient. A previously healthy 20-year-old male
student had been behaving in an increasingly odd way. At times he
appeared angry and told his friends that he was being persecuted; at
other times he was seen to be laughing to himself for no apparent
reason. For several months he had seemed increasingly preoccupied
with his own thoughts. His academic work had deteriorated. When
interviewed, he was restless and awkward. He described hearing
voices commenting on his actions and abusing him. He said he
believed that the police had conspired with his university teachers
to harm his brain with poisonous gases and take away his thoughts.
He also believed that other people could read his thoughts.

This case history illustrates the following common features of acute
schizophrenia: prominent persecutory ideas with accompanying
hallucinations; gradual social withdrawal and impaired performance
at work; and the odd idea that other people can read one's thoughts.

In appearance and behaviour some patients with acute schizophrenia are entirely normal. Others seem awkward in their social behaviour, preoccupied and withdrawn, or otherwise odd. Some patients smile or laugh without obvious reason. Some appear to be constantly perplexed. Some are restless and noisy, or show sudden and unexpected changes of behaviour. Others retire from company, spending a long time in their rooms, perhaps lying immobile on the bed apparently preoccupied in thought.

The speech often reflects an underlying thought disorder. In the early stages, there is vagueness in the patient's talk that makes it difficult to grasp his meaning. Some patients have difficulty in dealing with abstract ideas (a phenomenon called concrete thinking). Other patients become preoccupied with vague pseudoscientific or mystical ideas.

When the disturbance is more severe two characteristic kinds of abnormality may occur. Disorders of the stream of thought include pressure of thought, poverty of thought, and thought blocking. Thought withdrawal (the conviction that one's thoughts have been taken away) is sometimes classified as a disorder of the stream of thought, but it is more usefully considered as a form of delusion.

Loosening of association denotes a lack of connection between ideas. This may be detected in illogical thinking (knight's move) or talking past the point (Vorbeireden). In the severest form of loosening the structure and coherence of thinking is lost, so that utterances are jumbled (word salad or verbigeration). Some patients use ordinary words in unusual ways (paraphrasias or metonyms), and a few coin new words (neologisms).

Abnormalities of mood are common, and of three main kinds. First, there may be sustained abnormalities of mood such as anxiety, depression, irritability, or euphoria. Secondly, there may be blunting of affect, sometimes known as flattening of affect. Essentially this is sustained emotional indifference or diminution of emotional response. Thirdly, there is incongruity of affect. Here the emotion is not necessarily diminished, but it is not in keeping with the mood that would ordinarily be expected. For example, a patient may laugh when told about a bereavement. This third abnormality is often said to be highly characteristic of schizophrenia, but different interviewers often disagree about its presence.

Auditory hallucinations are among the most frequent symptoms. They may take the form of noises, music, single words, brief phrases, or whole conversations. They may be unobtrusive or so severe as to cause great distress. Some voices seem to give commands to the patient. Some patients hear their own thoughts apparently spoken out loud either as they think them (Gedankenlautwerden) or immediately afterwards (echo de la pensee). Some voices seem to discuss the patient in the third person. Others comment on his actions. As

described later, these last three symptoms have particular diagnostic value.

Visual hallucinations are less frequent and usually occur with other kinds of hallucination. Tactile, olfactory, gustatory, and somatic hallucinations are reported by some patients; they are often interpreted in a delusional way, for example hallucinatory sensations in the lower abdomen are attributed to unwanted sexual interference by a persecutor.

Delusions are characteristic. Primary delusions are infrequent, and difficult to identify with certainty. Delusions may originate against a background of so-called primary delusional mood - Wahnstimmung. Persecutory delusions are common, but not specific to schizophrenia. Less common but of greater diagnostic value are delusions of reference and of control, and delusions about the possession of thought. The latter are delusions that thoughts are being inserted into or withdrawn from one's mind, or broadcast to other people.

In acute schizophrenia orientation is normal. Impairment of attention and concentration is common, and may produce apparent difficulties in remembering, though memory is not impaired. So-called experiences result from illness, but usually ascribe them to the malevolent actions of other people. This lack of insight is often accompanied by unwillingness to accept treatment.

Schizophrenic patients do not necessarily experience all these symptoms. The clinical picture is variable, as described later in this chapter. The table below lists the most frequent symptoms found in one large survey.

The most frequent symptoms of acute schizophrenia (World Health Organization 1973)

Symptom Frequency (%)

Lack of insight 97
Auditory hallucinations 74
Ideas of reference 70
Suspiciousness 66
Flatness of affect 66
Voices speaking to the patient 65
Delusional mood 64
Delusions of persecution 64
Thought alienation 52
Thoughts spoken aloud 50

Various theories exist about Mike Corley:

1) he exists and is disturbed and has net access and for reasons uncertain spams a selected number of newsgroups on a regular basis - if you are reading this FAQ then you will almost certainly have seen

one of his posts.

2) Mike Corley is a 'virtual schizophrenic'. Mike displays the relevant features so well that some people think he may be a construction of one or more people with intimate knowledge of mental illness and the mentally ill. Perhaps they wish to monitor the effects on the internet of the posts of a schizophrenic. Moving into X-Files territory a bit, ourselves, here.

Mike's posts attract different responses:

1) cruel, humourous, dismissive posts from those who've seen his posts many times and have become generally irritated by his behaviour while accepting that he probably has a mental illness.

2) posts from Corley-newbies - those who have come across relateviely few of Mike's posts. These may be humorouous or disbelieving.

3) posts from people who have been sucked in (for one reason or another) into Mike's Wild & Wacky World (TM)

That's enough for now.

I used to love that game. That and Temple of Apshi. You are doing well, my 4yo is hooked on Lego Star Wars;-) He was showing an interest the other day in my modded 600XL. Maybe it is time to bring him to the light side;-)

Hey, it's pretty cool that you are getting the next generation familiar
with the classics. If I ever get off my lazy duff, I'm going to make a
module for either NWN2 or Oblivion that is based on the Apshai series.

There isnt a huge market, but its there.

Many people just donate their 8-bit stuff to 'collectors'. I've gotten a
few items that way. I know if i have them they will be well cared for
and see daylight (and AC power :)) every so often.

Eventually i hope to have the space to bring everything out at once and
leave it out. Sort of like that museum in that barn out west.

148. MI5 Persecution: Website Index (1931)

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-18 23:43:40 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07001900380368@4ax.com>
Source record: 5281
Cross-posted to: de.etc.schreiben.lyrik,tw.bbs.literal.lyrics,comp.sys.atari.8bit,fr.comp.sys.mac.materiel,sfnet.keskustelu.politiikka

Persecuted by the Security Service

Since June 1990 the British security service MI5 has waged a campaign of harassment against a UK citizen,
through the broadcast and print media, verbal abuse at work, and molestation in public and during travel.

Despite widespread knowledge of the campaign in the UK and discussion of its characteristics on Usenet for
over three years, it continues today both in Britain and North America. Its cause and basis is xenophobia
on the basis of the genetic accident of mental illness, coupled with discrimination against an inferior
"foreigner" whom they condemn as "not up to British Standards".

If this is your first visit to this site, please read the FAQ first. Feel free to contact the author with
any questions.

Frequently Asked Questions article outlines the parameters of the persecution. Who is involved, and why?
What technical and social means do they employ? What response have I made, and why has their campaign yet
to be exposed?

The UK Security Services which are believed to be behind it all. Domestic security is the province of MI5
while the secret intelligence service MI6 combats foes (and its former employees) on foreign shores.

Usenet archive chronicling the (sometimes very enthusiastic) exchanges which have taken place on UK-local
newsgroups since May 1995. Make your mark on the continuing discussion!

Believe it or not, a few items of evidence have been recorded. Although none of them is particularly
conclusive, by presenting them I hope to explain what I understand from some television and radio programmes.
Most of the "clinching" material was aired in 1990-92, and no recordings exist now, which is quite unfortunate.

My complaints to the BBC and MI5 (via the Security Service Tribunal and Interception of Communications Tribunal),
and their response to my challenges, are recorded here. Basically they deny everything, they have put their
denials (mostly - Buerk and Lewis refused) in writing, and I don't believe them. Part of

the website also
documents media coverage of my campaign to expose the persecution.

Faxed articles to, and responses from British organisations including Parliament and UK media. Over 24,259 faxes
in all were sent from 1998 to 2000. Their aim was to boot discussion of the persecution into the public domain,
and that aim was not accomplished.

20,000 Reward Offered to Expose the Conspiracy

I am making a pledge for information directly leading to the exposing of the "BBC Newscaster
Conspiracy". The exposing would specifically need to lead to a legally binding admission from Martyn Lewis
or Michael Buerk of the BBC they they were watching me through the TV set.

I would be happy (delighted, in fact) to pay GBP 20,000 sterling in reward for the above admission.

151. MI5 Persecution: Toronto Freenet supports free speech (4374)

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-19 03:41:37 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07001904360057@4ax.com>
Source record: 5284
Cross-posted to: de.etc.schreiben.lyrik,tw.bbs.literal.lyrics,comp.sys.atari.8bit,fr.comp.sys.mac.materiel,sfnet.keskustelu.politiikka

Despite an orchestrated campaign of attempted censorship by UK-resident newsgroup readers, TFN did not bow
to demands for a suppression of freedom of speech. TFN general policy on the matter is as follows;

Draft Policy on Account Deactivations due to News Group Postings
==========

News group postings occasionally take the form of a message which goes against the "topic" of the conference.
For example, a derogatory message about Canadians in the soc.culture.canada.

Members of such news groups then may send a message to the system administrators asking that a user's account
be terminated because of such posting.

The Toronto Free-Net Board of Directors has taken the position that the only postings that will get a person's
account terminated is material that is illegal under Canadian law. Otherwise, the Toronto Free-Net will not
take any action.

Freenet Executive Director Mike Anderson had this to say regarding the continued attempts of a minority of usenet
participants to have my account on his system deactivated;

The TFN's policy is not to take action against members unless they contravene the Criminal Code of Canada, or
engage in practices such as forgery, attacks against other computer systems or mailbombing.

Mr. Corley, while possibly being very annoying, has not contravened the TFN's policies. The TFN believes strongly
in freedom of expression, while recognizing that the price for such freedom may be a high signal-to-noise ratio in Usenet.

If Mr. Corley breaks the law, we will take action -- until then, he has the same rights as any TFN member to post
to Usenet newsgroups. Actions such as mailbombing the TFN in protest will be met by strong complaints to the
originating site's postmaster. The best defense against unwanted postings may be simply be to ignore them and deny
the poster an audience.

TFN Executive Director Toronto, Ont CANADA

Personally, I find it gratifying that my contributions to usenet discussion are recognized as being conducive
to a high signal-to-noise ratio by their quality and thoughtfulness.

Hi Anders!

Is it not with a cursor (player), which returns back to middlescreen
when releasing the choosen digital direction!? I am pretty sure....

(Maybe the 400/800 version is Analog-controlled....)

Best Regards,

Mostly. It won't be compatible with Super Carts or stuff like SDX.
Likewise I think $D100 is used by PBI stuff like MIO.

Fairly safe is $D600 and $D700 or $D600-$D7FF if you prefer. About the
only one that hacks on a regular basis in that area is Bob Wooley and
some minor ones by myself. I don't know about the latest hacks since I
have not been actively hacking of late.

There are a couple of good things about that area. Other then being
unused by most commercial software it is already decoded and has the !CS
lines coming out of the 74LS138 IIRC. That is, to add something like a
PIA or similar 68xx/65xx chip, you only need to jumper the !CS line to
the 74LS138, tie in the 8 data lines and 2-4 address lines for chip
registers and you are ready to go.

Another option is decode the address space into upper and lower halves
of the page. This moves POKEY, GTIA, ANTIC, down to $D300-$D37F using
the PIA as an example. To do this you only have to pull up one pin of
the 74LS138 and tie it to the 8th address line. I had one machine where
I piggy backed another 74LS138 onto the exisiting one like this but it
was really silly overkill. Just no way you are going to need an
additional 8 devices under the hood.

Mostly. It won't be compatible with Super Carts or stuff like SDX.
Likewise I think $D100 is used by PBI stuff like MIO.

>
Cool!

I'm not worried abut being incompatible with other carts because I am
talking about a physical cartridge of my own. I just wanted to know if the
whole range $D500-$D5FF is exclusive to cartridges.

Fairly safe is $D600 and $D700 or $D600-$D7FF if you prefer. About the
only one that hacks on a regular basis in that area is Bob Wooley and
some minor ones by myself. I don't know about the latest hacks since I

Definitely, don't need this for this cartridge project but that's something
to think about for future projects.

Thanks Rick!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Well, I did the Clearpic 2002 mod to my 1200xl. And it won't even power up!

I did a really neat job delsoldering and soldering..actually kinda surprised myself there..

So I guess I dont have the right parts?

Most of the resistors I used were 1W flameproof. I didnt know what to ask for, but I had the picture from the article and thas what they gave me. They are a much larger and blue, not like the creamy colored ones I pulled out. The only 1/2 watt resistor I had was the 47ohms, it was more like the ones already in the 1200xl.

And the 2 capacitors, I had trouble finding them. Again, I don' know what to look for, so I ended up with a "1000v 68pf" ceramic disc, and also a "1000pf" ceramic disc, don't know how many volts that one is.

Are these parts acceptable?

I've removed the stuff I put in, and now my board looks exactly like the one in the article, I'm hoping I can get her back working! She's got a 600XL OS!

Any help help would be great.

Charlie

Arrgh I got er working!

Odly, I guess I blew a power supply hooking it up for the first time after
the mod? Are you friggin kidding me? So anyway I took out the mod, and

after checking out another power supply sure enough it powered up. Man I was happy about that though. So I started again, and checked power after every solder. After a few I got black and white. Then color!

Well it's 2:30 a.m and Im going to go enjoy my smokin clearpic 2002 1200xl!

Could you please explain, why? I.e. why you're assuming, that everyone
who is reading c.s.a.8, must at the same time be interested in the
stuff that is posted to "your e-mail list"?

I am not so familiar with the different hardware modifications available.

Please describe what the result of the clearpic mod looks like (assuming the purpose is to give a clearer screen picture). Are there any side-effects or disadvantages?

Anders

174. FS eBay: Atari XL/XE QUICK programming language less than $2 + RCA/SCART Cables

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-21 13:26:12 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1169385975.10216.0@proxy02.news.clara.net>
Source record: 5107

Hello All,

I am selling electronic copies of the QUICK programming language on eBay (which includes ATR and DCMs of the disks and a PDF manual) for just ?0.99 (less than US$2). This is a promotional price to 'test the waters' with this kind of distribution, so if you want to take advantage of it, you can buy one on eBay now:

UK/Europe: http://search.ebay.co.uk/_W0QQsassZdeangarraghty

US: http://search.ebay.com/_W0QQsassZdeangarraghty

Full info on QUICK and what is included, and how the product is sent to you is in the listing.

I also have available Atari to SCART and Atari to RCA cables too.

Dean Garraghty

You can use a trackball in joystick mode but it won't really work like
you want. The 8bit computer version
does work with trackball btw. I think there is a hacked version of
Missle Command out there for the 2600 that does
support true trackball use.

178. High resolution with 16 colors.

20070116

Hello!

I was looking at the graphics of the
Atari XL, and noticed that the amount
of data for a graphics 11+16 was the
same as a graphics 7+16 BUT having
also 16 colors (instead of only 4).

Graphics 11+16:
80 x 192pixels x 4 bpp = 61440/8 = 3840 Bytes
Graphics 7+16:
160 x 96 pixels x 2 bpp = 30720 = 1920 Bytes

This calculations show that the graphics 7+16
still consumes only 1/4 the data of a 11+16.
So, my question to the GTIA experts is...
is it possible to program GR.7+16 in 16 colors?

Thanks!

20070121

Today in pouet.net I saw
a game for Atari XL with
graphics 15 (160x192) with
more than 8 colors! Maybe
they are 16...
How is this possible?

Any programmers willing to tell?

http://pouet.net/prod.php?which=29245

Greetings.
so_o2

OK, first off real foggy so bear with me. I know this will need
correction but it is a reasonable approximation of what happens.

The Atari screens are mostly 40 bytes wide. That is why you get 40
columns in Graphics 0 screens.

The mode determines how those bytes are displayed. For instance in GTIA
mode you may have a byte whose bits go

XX:YY:XX:YY <could be XX:XX:YY:YY but I forgot?>
Where XX will be 0-15 and YY is the bit pattern.

In the modes like Graphics 7 and 15 the colors upper nibble specifies
color registers for the associated pixel.
AA:BB:YY:ZZ

Such that AA selects 1 of 4 color registers which may have a value from
0-255 in it for the YY pixel and BB selects the color register for the
ZZ pixel.

So the difference is: Instead of selecting one of 16 values for video
attributes the byte the nibble is broken down to indirectly address a
color register.

Yes you only get 4 colors on screen at the same time with Graphics 7,
but those colors can be anywhere from 0-255 in the color register.

> So, my question to the GTIA experts is...
> is it possible to program GR.7+16 in 16 colors?

No. You can arrange antic and gtia such that you
get a Gr.11 like mode with pixels as high as those
in Gr.7 (that is, twice the height) and thus half
the memory footprint, but you won't get a mode with
16 colors with pixels half the width of Gr.11 but
with 16 colors. You can of course "trick" a bit in
the sense that you show one set of 16 colors every even
frame, and the other set every odd frame and thus get
a larger amount of colors, just flickering. The amount
of flicker can be visually reduced a little bit by
altering the colors also line by line, but you won't
be able to get a steady picture with 16 colors and the
Gr.7 resolution and colors arbitrarely placed on
the screen.

Gr.11 isn't really a "graphics mode". It is, as far
as the DMA controller is concerned (that's ANTIC) just
a standard Hi-Res mode as Gr.8, and the display-lists
for the two modes will be identical. Just the color/TV
signal generator GTIA will interpret the data differently,
so Gr.11 is more a "postprocessing hack" than a screen
mode.

> Today in pouet.net I saw
> a game for Atari XL with
> graphics 15 (160x192) with
> more than 8 colors! Maybe

> they are 16...
> How is this possible?

Several techniques are possible. The classical one is
to use DLIs (display list interrupts) to change colors
on the screen, which leaves you with the four-color
restriction but only on lines, you can change them
vertically. If you wish to spend more CPU time, you
can also try to change the colors horizontally by a
kernel, which is tricky. This won't enable you either
to place the colors arbitrarely on the screen, either.

A third technique I've already described above is to use
flickering and mixing graphic modes this way by altering
them on the screen. One idea is to combine Gr.11 and Gr.9
and thus get 256 "mixed" colors with the resolution of
Gr.11, another one to mix Gr.10 with Gr.9 or Gr.11 and thus
get "more" colors with the resolution of approximately
Gr.15. The reason why that works is that Gr.10 has a
horizontal displacement of one color clock on the screen
(likely because GTIA requires the time to fetch the
contents from the color register), and thus Gr.9/11 and
Gr.10 pixels are shifted relatively to each other by
exactly one half of their pixel width. By altering the
two modes you get something "near" Gr.15 resolution,
but with some flicker.

So long,
Thomas

The good thing about the $d500 area is that the required chip
selection signal is available on the cart port, but you would need
extra logic to decode $d100 in the cart.

Several addresses in the $d5xx area are used by a third-party real-
clock extension with a pass-thru cartridge slot, so if you want to be
compatible with this extension, you would need to avoid these
addresses. I don't remember them off my head, but I can look it up.

>>

Well, "incompatible" in which sense? If you want to have your cart to
be inserted along with other cards (i.e. you have a pass-thru
connector), then it would matter. Otherwise, it won't.

> Fairly safe is $D600 and $D700 or $D600-$D7FF if you prefer. About the

Me, too. I'm using the $d600 area for some of my projects of myself.
(A voice interface, a parallel printer interface). But it's fairly free,
and who cares about compatibility with those hacks?

Yup. Unfortunately, the line is not available on the PBI, so I had it
added there.

> additional 8 devices under the hood.

Some hacks use A4 to decode an extra pokey in the machine, that is,
pokey #0 goes into D200..D20F, the second into D210 to D21F (plus
all multiples of 32, of course).

There are video mods for all the 8 bit's I believe. The results are great. I cant really describe it. It's Atari video, only more so. It's gotten rid of a lot of noise. It's smoothed out some vertical bars I always see in solid color backgrounds, not eliminated the bars. I never cared about the video until I tried to get something done looking at text for extended periods.

Side affects? I'm noticing blue popping up where I think there should only be thin-bright-white. Not the normal white you see in the DOS menu for instance. I've adjusted the wheel on the board but can't get it to go white. Maybe this is the components I used, maybe this is normal. It's worth the tradeoff though, everything else looks fantastic. And I'm not even on a Chroma/Luma setup. I'm happy I did it. I wouldn't go back. I've only had a few hours really checking it out though.

Source record: 5119

Hello,

it's always possible to use Player/Missiles (Sprites)
as overlays to generate more colors.

And don't forget that multicolor character modes (Graphics 12 and 13)
have 5 instead of 4 colors.

Go to www.atariage.com and search for "Graph2Font"
or try a Google search.

This program allows you to create pictures with Player/Missile
overlays and DLIs. There are many demo pics around.

Even in plain BASIC, this technique can be used and even
new colors are generated at the places where players and
background pixels are located.

In games, a combination of software sprites and
P/M overlays is possible, while DLIs are used to
improve the background graphics.

Does also work in HiRes mode (320*192), but limited.

Check the Multicolor and HiRes demo pics of Graph2Font.

187. Re: More colors -> Player/Missile overlays - Check Graph2Font

Here is the link to the "Graph2Fnt" topic on www.atariage.com :

http://www.atariage.com/forums/index.php?showtopic=34916&st=0

There are many demo-pics and links.These pics show that the
ATARI 800 can do much better than the standard 4 color pics.

Btw., if you like good POKEY music, try this thread :

http://www.atariage.com/forums/index.php?showtopic=68283&st=0

It's about RMT, a program that can be used to create high-quality
music on the ATARI 800 with effects you never heard before.
There are some of converted C64 SID songs for download.

It's a bug ported over from the original Atari BASIC (yes, TurboBasic
is a drilled-up Atari Basic). It "confuses" the CTRL-R ATASCII character
with the token for the semicolon.

I've a version where I fixed this (plus a couple of other things).

So long,
Thomas

Hallo Thomas,

How do you write an Atari BASIC program that reproduces this
fault? Please post a tiny example program.

Anders

Exactly the same way. Try to print a string that ends with ^R.
Not all versions of Atari basic had this bug, though. It got
fixed in either Rev.B or Rev.C, I don't remember.

Hi Thomas,

You said, "I've a version where I fixed this (plus a couple of other
things)."
Since this bug now troubles me would you post a fix for Turbobasic:
bytes and offset might be enough.

TIA,
RoyE

Thanks Rick! Thanks Thomas!

I was only concerned with internal projects that may have used
$D500-$D5FF. After some thought I realized this cannot be the case
otherwise there would have already been conflicts with existing
cartridges.

I don't have any pass-thru cartridges so that is a non-issue for me.

Thanks for all the additional practical tips. Good to keep in mind for
future projects.

B&C (www.myatari.com) has Miditrack II.
It comes with the interface, however, not just
the software.

Thanks for answering. This sounds like something I would like
to have on one of my Ataris.

Somewhat related: We played Burgertime on an Intellivision last
weekend, and although its video (RF) output was far from perfect, at
least the colours were clear. I was particularly impressed by the low
level of colour bleeding.

Well hello!

They offer some of the best premium newsgroup access anywhere.
You can find almost anything you are looking for.
Great prices and support await you as you travel into the beautiful world of premium nntp access.
One thing I love about them, they don't keep log files of the news I read or files I download.
With some of the fastest connections around it's no wonder people love it and keep coming back.
Take a look, I know you'll love it as much as I do.

800 GIGS of new multimedia content each day
Posting allowed!
2,000,000 new posts each day
Very long retention

I'm so glad I found newsdude.net and you'll be glad too!

Hey all, I was curious about location R63 on the 1200xl motherboard. I just did the 'Clearpic 2002' video mod, where your supposed to put a 1 ohm resistor at location R63. Thing is I've read that this is the same resistor that is to be removed and replaced with a wire if you want to add the +5v back to the SIO port. Does this location have anything to do with the video circuit? Or did the author of the mod figure "while your in there, add +5v back to the SIO port" and not mention it?

Just curious,
Charlie

Nothing to do with Clearpic. It's just so you can run sio powered stuff
like PR:Connection. It was never clear why Atari added the resistor in
the first place.

Rick

Ok thanks. So then my next question is, will a 1 ohm resistor (in the
Clearpic 2002 instructions) work the same as a wire, do I have the
power back on the SIO port now?

Charlie

203. Atari XL Basic bug.

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-24 21:11:44 UTC
From: SoLo2 <so_o2@mailcity.com>
Message-ID: <1169673104.482008.180750@h3g2000cwc.googlegroups.com>
Source record: 5136

```
Hello!

I was programming the Atari XL
in BASIC, but using Atari800
emulator, version 2.0.2 under
Linux.

I came to the following bug,
when using "COLOR 125" or
"COLOR 155" in a high
resolution graphics mode
(8,11,15,...).

First look at this simple
program in graphics 15:

1 GR.15+16
2 COLOR 1: PLOT 0,125:DRAWTO 50,125
3 COLOR 2: PLOT 0,155:DRAWTO 50,155
4 GOTO 4

Works fine. And paints 2 lines,
horizontal in 2 different colors.

Now I try using very high COLOR
values, the same I use for the
height of each line:

1 GR.15+16
2 COLOR 125: PLOT 0,125:DRAWTO 50,125
3 COLOR 155: PLOT 0,155:DRAWTO 50,155
4 GOTO 4

Well, this won't work. And paints
a strange and rare picture, like
a torch...

Does anybody in the Atari World
know why?

Greetings,
SoLo2
```

Well, this is not an "Atari BASIC" bug, the problem is in the operating system ROM, in the screen handler to be specific. Its "plot" routine is in fact sending characters to the "S:" device, the ASCII code of the character is COLOR to be plotted and they (the chars) endup as appropriate bit patterns in the screen memory, and later the Antic chip + GTIA chip interpret them as color pixels.

Now, the device has two control characters: ASCII 125, which is "clearscreen/cursorhome", and ASCII 155, which is "newline". So, COLOR 125:PLOT x,y doesn't draw anything, just clears the screen and sets the graphic cursor in the upper left corner of the display. Next, you want it to draw something to 50,125 - so it does, this time avoiding clearing the screen as every pixel is drawn, because the DRAW uses a lower-lever graphic routine than the PLOT, and the lower level routine does not interpret characters.

So, the first PLOT/DRAW begins and finishes the line, where it had been told to (from 0,0 to 50,125). But why the other PLOT/DRAW draws actually a vertical line (it does the same if you use COLOR 125 instead of 155), it is beyond me at the moment. :)

It's not related to Atari Basic. It is a "design flaw" of the
operating system, namely the S: handler. The problem is that this
handler interprets the two values as control codes, 155 as EOL/line feed

and 125 as clear-screen. It really shouldn't - that would be the job of
the E: handler. Unfortunately, E: and S: are rather... entangled.

So long,
Thomas

Just as a by the by comment. If you aren't using the other functions in the OS like character under the cursor or last character, you can really speed up the system by using your own drawing/plot routines. The Atari is really something special, it is almost like a word processor with the data saved and cursor movements. While safe and feature laden, it slows things down a bit.

As long as you aren't plugging in something that is a dead short, a wire IMHO would be prefered. I've never used anything but wire on maybe 6 1200XL and no problems.

It might be an error in the Clearpic 2002 instructions?

Right, I'm not really concerned about the power, more that there is another resistor that really should be replaced with the 1 ohm resistor that could improve my video circuit.,

211. MI5 Persecution: Toronto Freenet supports free speech (130)

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-25 19:35:50 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07002520301207@4ax.com>
Source record: 5144
Cross-posted to: de.etc.schreiben.lyrik,tw.bbs.literal.lyrics,comp.sys.atari.8bit,fr.comp.sys.mac.materiel,sfnet.keskustelu.politiikka

Despite an orchestrated campaign of attempted censorship by UK-resident newsgroup readers, TFN did not bow
to demands for a suppression of freedom of speech. TFN general policy on the matter is as follows;

Draft Policy on Account Deactivations due to News Group Postings
==========

News group postings occasionally take the form of a message which goes against the "topic" of the conference.
For example, a derogatory message about Canadians in the soc.culture.canada.

Members of such news groups then may send a message to the system administrators asking that a user's account
be terminated because of such posting.

The Toronto Free-Net Board of Directors has taken the position that the only postings that will get a person's
account terminated is material that is illegal under Canadian law. Otherwise, the Toronto Free-Net will not
take any action.

Freenet Executive Director Mike Anderson had this to say regarding the continued attempts of a minority of usenet
participants to have my account on his system deactivated;

The TFN's policy is not to take action against members unless they contravene the Criminal Code of Canada, or
engage in practices such as forgery, attacks against other computer systems or mailbombing.

Mr. Corley, while possibly being very annoying, has not contravened the TFN's policies. The TFN believes strongly
in freedom of expression, while recognizing that the price for such freedom may be a high signal-to-noise ratio in Usenet.

If Mr. Corley breaks the law, we will take action -- until then, he has the same rights as any TFN member to post
to Usenet newsgroups. Actions such as mailbombing the TFN in protest will be met by strong complaints to the
originating site's postmaster. The best defense against unwanted postings may be simply be to ignore them and deny
the poster an audience.

TFN Executive Director Toronto, Ont CANADA

Personally, I find it gratifying that my contributions to usenet discussion are recognized as being conducive
to a high signal-to-noise ratio by their quality and thoughtfulness.

Newsgroups: alt.conspiracy
Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984?
The ones which watched you back? Which you could never get
rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has
made his nightmare follow into the world after him.
Since 1990 the British have been waging war against one of
their own citizens using surveillance to invade privacy
and a campaign of abuse in the transmitted media in
their efforts to humiliate their "victim".

And the most remarkable thing about it is that what they
do is not even illegal - the UK has no laws to protect
the privacy of its citizens, nor does it proscribe
harassment or abuse except in the case of racial abuse.

A lot of people in England know this to be going on,
yet so far they have maintained perfect "omerta";
not a sound, not a squeak has escaped into the English
press, and for all the covert harassment absolutely
nothing has come out into the public domain.

Have the British gone mad? I think we should be told.

From: "Mr.B" <dgb01@stir.ac.uk>
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame
Date: Mon May 8 05:32:13 1995

Mmmm.

Who, exactly is this victim you're talking about?

First up, Britain or the UK (not 'England' - England is
a part of Britain, like Kansas is a part of the USA) does
have laws that protect the individual from harassement -
you can't just threaten people willy nilly. There are laws
against that. And if someone lies about you in the press
or tv then you have recourse to libel/slander etc. laws.

True, Britain has no 'privacy' laws as such, but isn't that
a good thing? As of this moment, the govt. are considering
a privacy law, but it is unlikely to succeed. Why? Because any
such law would benefit the priviledged and those in power.
Privacy laws, while supposedly protecting the individual, help
those in power hide their mistakes/scandals. They stop the press
etc. investigating. Privacy laws are undemocratic - they prevent
the people from keeping an eye on govt.

And stop looking for some kinda conspiracy in the British
press. It's hardly perfect, but your notion that they don't
cover/campaign against press legislation, harrassment,
discrimination, human rights etc. is plain wrong. You've never
seen a British paper in yr life.

You clearly have a specific case/individual in mind. Speak up!
The thought police aren't coming round just yet.

Douglas.

Date: Mon May 8 19:21:28 1995
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame

Confession time - the victim is/was me (except my name isn't
Corley, but that's irrelevant). What happened was not threats;
just invasion of privacy, in a partiicularly flagrant and
shocking way, in a way which most people would consider to
constitute harassment.

You know there's a particular category of person with mental
illness to whom TV and radio "talk", ie they feel the broadcast
is directed at them in particular? This happpened to me,
quite some time ago in the UK (I'm originally from London,
so I've seen plenty of British media print and other).
They invaded my home with their bugs, they repeated what I
was saying in the privacy of my home, and they laughed that it
was "so funny", that I was impotent and could not even communicate
what was going on. Who did this? Our friends on BBC television,
our friends in ITN, last but not least our friends in Capital
Radio in London and on Radio 1.

How did they do this? I'll give you an example. About a year ago,
I was listening to Chris Tarrant (Capital Radio DJ among other
pursuits) on his radio morning show, when he said, talking about
someone he didn't identify, "you know this bloke? he says we're
trying to kill him. We should be done for attempted manslaughter"
which mirrored something I had said a day or two before
(I'm not paranoid, honest!). Now that got broadcast to the whole
of London - if any recordings are kept of the shows then it'll be
there.

You mean the category where they think that everyone is after them ? that
one ? So lets get this straight you know you are paranoid and you think
that they are out to get you ? Uh huh, try putting the two together and
see what you come up with.

>quite some time ago in the UK (I'm originally from London
>so I've seen plenty of British media print and other).

>Radio in London and on Radio 1.

Oh yeah, I can see it now. All of them banding together, in a united effort against one man. So ITN, the BBC, and Capital all decide to sit round the table and they come up with idea of breaking into someones house, putting bugs everywhere, listening in to his conversation, and shoving it out on the news everyday. This someone has nothing to do with politics, or business, or entertainment, just an ordinary Joe Bloggs who seems to be extremely paranoid.

Have some sense, grow up and smell reality. What you are talking about would take loads of planning, tens of thousands of pounds and lots of people involved in the planning, execution and maintenance of it. You must have a very high opinion of yourself to think you are worth it.

>How did they do this? I'll give you an example. About a year ago,

Of course you are not paranoid, just slightly mad. Did you ever look for the bugs in your house ? If not, why not ? I mean if I thought that was happening to me, I'd search the place from top to bottom, I mean I live there I would know if anything was out of place. If I was really paranoid, whoops I mean suspicious, I would call in one of those bug detection teams which have those machines that pick up the transmitted radio waves. This reminds me of BUGS, that new programme on BBC1 on saturdays which is all about this kind of stuff, but, shown as a drama / thriller. I suppose thats based on you as well is it ?

>is that there is a conspiracy in Britain, that it encompasses the
>broadcast media, and there is no way of breaking the conspiracy.
>The people who are involved in it will not open up.

What a load of jolly hollyhocks, I would say something else but, apparently students are not allowed to swear on newsgroups in case it damages the reputation of the university or some such jolly hollyhocks.

This guy is extremely paranoid to suggest that the entire British media is after him in such a big way. He gives no real reason as to why they are after him, just that he suffers/suffered from a slight mental disorder, could it be paranoia perhaps ?? No surely not.

I put it to the house that he has never recovered from this mental disorder, lets come out with it and call it paranoia, and thinks everyone is after him. Remember just because you aren't paranoid, doesn't mean they aren't after you.

This guy has a serious problem to suggest that the media would go to such lengths just to single out and ridicule one person. I mean apart from anything else, we (the listening masses) wouldn't be interested unless it concerned the royal family, politicians or showbiz personalities. e.g. the camillagate tapes. I would think that almost everyone, no matter how much they went on about infringements of privacy read the transcripts with interest. I really don't think that Joe Bloggs ordinary guy or paranoid nutter would have the same appeal. Well actually I dunno. :)

Regards,

Paul.

That is what happens in big cities. Hell, it scared me to death when I first started working in Manchester. People keep talking to me on the streets, even if its just to say hello, and I've no idea who they are. This happens to most people, don't worry about it.

>>paranoid, whoops I mean suspicious, I would call in one of those bug
>>detection teams which have those machines that pick up the transmitted

>That's exactly what we did. We went to a competent, professional detective
>agency in London, paid them over 400 quid to debug our house. They found
>nothing.

Doesn't this suggest to you that there are, in fact, no bugs to be found?

>Over Easter I went to the police in London, telling them basically
>what I've posted here. I don't think you'll be surprised to learn
>that I didn't get very far; they asked "why would they be doing this to
>you in particular?" and the answer "they are because they are" doesn't
>go very far.

Exactly. All you have offered so far as proof of your harrassment by these people is:

1) Someone on radio said something that you had recently said
and
2) People on the streets seem to recognise you.

These are both perfectly normal occurences and happen to lots of people every day so it is unsurprising that people here, and the police, are not taking you seriously.

Trying to always keep an open mind about things I would say that one of three things is likely.

Either there is a lot more to this that you are not telling us, or you are messing about or you have some genuine delusions. I'd like to think that in

two of the three cases you would find some real support here, but it seems
unlikely I'm afraid.

Claire

>to most people, don't worry about it.

The key is the pattern, or a change in the pattern. I've lived in London
almost all my life, and just walking around the streets, I never got
hassled by anybody. All of a sudden, people start harassing you,
throwing abuse at you, behaving as if they know you personally, as
if they've seen you before somewhere. I read in the papers that this
happens to Colin Stagg and people like that Eastenders actress, but
they've had their picture in the paperes, so that is understandable.
In a couple of cases people have even known my name - when I was in
London over Easter I was walking down Shaftesbury avenue in the
West End when somebody (no idea who they were, just some bloke with
his girlfriend) called me by name - quite clearly, and my name is
distinctive. This also happened once about four 1/2 years ago, onn
the tube - some blokes I had never seen started chanting my name
and a term of abuse.

It's the pattern which convinces me there's something to it - and
would convince any impartial abserver who could see things tyhrough
my eyes.

>Doesn't this suggest to you that there are, in fact, no bugs to be found?

There's a little story behjjind this. First iof all, in 1992 I worked
for a company where the people made clear they knew what was going on,
first of all directly (the very first evening I was there I went out to
the pub with them and the Technical Directpor said to another guy,
"is this the bloke who's been on TV?" "yeah, I think so") and also
indirectly, by rep[peating stuff I was saying at home in London and
in my rented accomodation there (I moved several times in the course of
1992 and they followed me each time). Now, if "they" (the buggers)
knew their bugs could be found easily, they wouldn;'t be keen to make

their existence known, would they?

Also, in summer 1992 I went on a trip abroad to Europe by coach, and
on the way out there were a couple a little younger than myself on the coach
a bloke and hius girlfriend. He said things about some bloke who was
never named, who sounded exactly like me - and he made explicitly
clear that our house was bugged, and that a neighrbours house was
bugged (and at work they'd been rep[earting what was said at the
neighbours, so this looks like independent corroboration).
They also said stuff like "at school he was always really streesed,
they found someone from his school and he was a real psycho"
and that "he was in a B&B for one night and they got him", dead right
again, I had been in B&B for once night a few days before this trip
and weatching the news again got a reaction from the newsreader.

Subject: Re: BBC's Hidden Shame

>:some pirate radio station in London in 1991, started listening to
>
>Conclusive proof if ever I heard it.
>
>Of course you were the only person in the office in the whole of Britain

Yeah, but this is the point. Each incident is easily and automatically
deniable along the lines you're taking. But when this happens every
time, and when you get independent corroboration from other people,
then there's no escaping it. For example, immediately after I lost
my job in 91 I went into the local garage to get some work done on the
car, and one of the blokes there said to the other, "so what do you
think of it then? it's getting killed on the radio isn't it"
Now again, you look at that and no proff; you can ask them what they're
referring to and they can say they're talking about something else.

>I know you may be a little paranoid, but I suggest you sit down
>and work out rationally what possible reason anyone off television,
>or radio would have for listening to your conversations. After all
>it must be hard enough to present a show to millions of people
>without the added burden of watching and listening to a single
>person and slipping their phrases into the programme.

These presenters are clever people. They wouldn't be presenters
if they weren't - they're easily capable of reacting to an individual
in this way.

What possible reason? I guess because they think it's amusing to do
so. They know that if you ever tell anybody, without being able to
show any evidence, then the reaction you'll get from just about
anybody will be the one you're showing now.

I realize there are loads of people in England and elsewhere with
the sort of thoughts I've described in these postings; and almost
all impartial observers would say that nothing other than an
go after their private conversations (if they did it to me then I can
do it to them, it's a questions of technical competence and money).
If you were lucky, you might be able to entrap them into admission.
You could of course harass or threaten them back (any coppers reading
this?) but that would be illegal and might get a result quite
different to the one you're trying to achieve. Of course, it might

come out of its own accord given time - if so many people know, if
they have an escape valve in their "subtext" through the media,
will it not cease to be at a covert level, given time? Surely it
is in my interest for it to become overt, since the transgressions
at this time are on their side and not on mine?

Thoughts? There must be some way of breaking the secrecy. This
isn't the first time in human history that a conspiracy has taken
place on this scale, but the truth tends to out. The situation
now is they think they';re "winning" hence have little stimulus
to change the rules - if they started seeing themselves "losing"
things could change drastically.

Mike, if that is your name,

I'm going to try to rationalise what you're telling us. I can think of three
possible explanations for what you are experiencing.

One is that there _is_ a conspiracy against you. As a previous writer said,
though, a lot of these programmes are taped, so it really isn't possible in
some of the cases you've named. Further, why were no bugs found in your
house? Finally, unless you are a political figure or someone else in the
public eye, why would anyone bother? People like me (and I assume you) are
small fry; our contribution to society is likely to be minor. Why would
anyone spend so much money and effort on you?

Another possibility is that you are developing some kind of paranoia. There's
no stigma attached to this; we're all paranoid to some extent, although
perhaps not to the extent that a doctor would call us paranoid. I think
paranoia is quite a straightforward explanation here - you really do believe
that all these things are aimed at you; you see people everywhere trying to
get at you. Logic suggests that this cannot really be the case.

The third possibility is that not even you really believe any of this, and
that this is a "troll". I'm not sure I believe this possibility, but it's
possible.

Anyway, if you want to be sure that you're _not_ going mad, I'd go and see
your G.P. if I were you. If you don't trust him/her, why not see someone

recommended by a person you can trust? If you don't trust anyone any more,
don't you think it's time you got help?

For a troll, the posts are remarkably well-informed on paranoid
behaviour.. you'd need to be one, or be reasonably well-informed on the
subject to sustain the tale... which lead me to my theory...*ahem*...:

An extension to possibility 3 (Number 3.5, perhaps?) is that the original
poster may be somehting like a psychology student writing a term paper
on the net community's reactions to this tale. (Now, there's paranoia
for you! Not only are they listening to/watching us, they're writing
reports about us too...:-)

More likely, though, is that the poster is genuinely in need of professional
help (he has intimated as much, himself) and, as such, he should be encouraged
to seek it.

> Done that; those around me either don't believe me, or they
>"sort of" believe but can't do anything about it. As for going
>to the police; I did, over Easter. Discouraging. They must be
>familiar with the occasional person walking into a station with
>this sort of story. "If a psychiatrist says you're imagining
>it, then that's what it is".

You haven't yet given any examples of anything concrete to suggest that this
is really happening to you. This, I would imagine, will be the stumbling
block for the police. How can they possibly help you when your only evidence
is a jumbled mess of TV presenters saying things that could be construed as
answers to your comments and the 'feeling' that people are talking about you
and watching you?

I seem to recall that last time this was being discussed someone asked if you
had been to see a psychiatrist about this - after all if this is really
happening then you have can only benefit from being given a clean bill of
health. I don't recall an answer.

> I also went to a firm of solicitors; again, very
>discouraging. Put bluntly, they can't deal with cases where the
>perpetrators aren't well-defined and the existence of the crime
>itself is unprovable.

Well how could they? Who would you sue? The country?

>o so if that option is out, what's left? well, there's the
>"do nothing" option. To some extent this option works. They've
>spent a lot of money and ultimately achieved nothing except to
>force me out of the country - which has been an own goal for
>them, since now they can't do what they were doing in the UK.
>Expenditure of further resources would feed the pockets of
>their greedy contractors, but is a waste of money as far as the
>employing organization is concerned.

So you are no longer in the uk? And this is not happening anymore?

Then let it go. Just leave it alone and get on with your life. Its just not worth it. There is nothing you can do to prove that this happened whether it did or did not. So forget it. Go and explore the net - when people aren't spamming it with useless repetitve posts there's a lot of interesting and worthwhile things out there to see and do. Likewise real life (I'm told *&).

>completely conventional, I have a good academic and work
>record. Until all this started, I had no mental health
>problems; the diagnosis of illness was only after 2 1/2 years
>of abuse. If they did this to me, they could do this to
>absolutely any British citizen. If this stuff gets out, it
>won't be me that has to worry - it'll be them. They take a
>normal person, lie about him, demonise him, try to force him
>into killing himself - and this is in a country where the rule
>of law applies?

If this gets out then *that* will be the time to bring your claims to the foreground.

The only thing ruining your life right now is you, Mike. And the only thing that will make your life any better now is also you. So go and make your life better and show them that they failed.

Claire

==========

>But we've *done* that. I certainly have at least. Way back when you
>originally started posting and your posts were neither tediously repetitve
>nor stupidly long.

Once again we're running into a brick wall. The reason I started posting was because I couldn't figure out a way out of the situation, and thought that saying it out into the open would provide a catalyst for one of those "in the know" (there are plenty in this category, and it's a fair

bet that some of them are reading this) to speak up.

It hasn't worked, yet. A little more aggressive shit-stirring (excuse expletive) might do the trick. Perhaps Usenet posting is the wrong arena for this sort of activity; although obviously it does have the advantage of rapid feedback.

Thing is, for people to open up, you would have to provide them with a reason why it would be in their interest to do so. There's no obvious way of doing that; to get thinking people to incriminate themselves when they're safe in denying all knowledge is not a trick I can figure out how to do.

>But whenever anyone makes any good suggestions you ignore them and start
>posting from the begining again. You don't want us to help you - so what do
>you want? If you really wanted help you would listen to peoples suggestions
>and respond to them. Is this just an attention thing?
>But I'll try again, because I'm a fool like that.

A "good" suggestion would be one which had the effect of halting the persecution, which so far hasn't happened. If you make a "good" suggestion then damn right I'll stop posting - because then I won't have to.

>You haven't yet given any examples of anything concrete to suggest that this
>is really happening to you. This, I would imagine, will be the stumbling
>block for the police. How can they possibly help you when your only evidence
>is a jumbled mess of TV presenters saying things that could be construed as
>answers to your comments and the 'feeling' that people are talking about you
>and watching you?

Because, as said previously, concrete proof does not exist. If it existed then I wouldn't be talking to you - if it could be proved, or if those doing it could be found, they wouldn't be able to continue.

What's happened is all conversation. You can't prove conversation, not without a tape recorder, and even then you would have to prove that what they meant corresponded to what you understood.

The psychopath who manages the Applics group at my previous employers played little word games, not only with me but with at least one other person in the group; words which rhyme with swear words, words which are ambiguous, eg "bent", words which rhyme with wank, "sheet" rhymes with shit, end (how was your weak end? being the standard salutation on a Monday morning). Sounds childish, most people would easily tell him to fuck off; except to people with predisposition to depression and the inability to express themselves (this was before I started taking medication), that sort of nastiness is not bearable. After ten months of this I was so ill I was crying constantly, eventually I went into hospital and started on medication. Somebody else he did this to (over a year later!) got so depressed he took an overdose of pills, had to go on antidepressants and left.

And where does the "concrete proof" of this trouble exist? NOWHERE. Even if you had physical evidence, even if you had the presence of mind to record what was said, how could you prove what he actually meant by what he was saying? In some cases of harassment you can prove what was done,

because it's undeniable. But when the harassment is done with any presence of mind whatsoever, it becomes difficult. In the case of the wider harassment, the people doing it obviously know what they're about - they must have done similar things to other people before in one form or another, and they know what they can get away with, they know what the police will do nothing about.

>I seem to recall that last time this was being discussed someone asked if you
>had been to see a psychiatrist about this - after all if this is really
>happening then you have can only benefit from being given a clean bill of
>health. I don't recall an answer.

Yes. The reply was of the "neither confirm nor deny" variety. Not much else they can say, is there?

>Well how could they? Who would you sue? The country?

Hmmm, now there's a thought... :-)

>If this gets out then *that* will be the time to bring your claims to the
>foreground.

Wrong way round. It won't get out unless I do something to bring that about; remember, it isn't in THEIR interest for THEIR criminality to be exposed. Yelling loudly on Usenet might nudge things along in the right direction.

>The only thing ruining your life right now is you, Mike. And the only thing
>that will make your life any better now is also you. So go and make your
>life better and show them that they failed.

Ignoring them would be bliss, but it's not a winning strategy.

There are going to be more of these posts. Sorry. That's the way it is.

219. MI5 Persecution: But why? 2/8/95 (4655)

Newsgroup: comp.sys.atari.8bit
Date: 2007-01-25 21:15:36 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07002522095893@4ax.com>
Source record: 5153
Cross-posted to: de.etc.schreiben.lyrik,tw.bbs.literal.lyrics,comp.sys.atari.8bit,fr.comp.sys.mac.materiel,sfnet.keskustelu.politiikka

>Very unstructured, no proof whatsoever. So why should anyone
>take it seriously? If I said to you, "my next door neighbour eats
>babies", how much credibility would you attach to that?

Well, cos it's true. I was hoping that someone "in the know" would
appear and make some self-revealing comments, but that hasn't
happened. Everyone's keeping quiet. What a pity.

>>This is an agglomeration of articles and replies previously
>>posted to Usenet, so it's a bit hard to read. This posting
>>describes a campaign of character assassination initiated

>Who's character is being assassinated? It isn't clear from the post.
>Are we talking about Grenville Janner? I thought he was a spook
>himself? He's certainly able to hold his own on the issue you cite.

Mine, mainly. The reason for putting that episode at the top
of the posting is that they tried to kill two birds with one stone
at the Beck trial - they simultaneously put words into the mouth
of their invented "witness" to smear Janner, and repeated exactly,
word-for-word, stuff which had been said by and about me.

That was the only occasion (the only one recognizable to me,
anyway) when they went after another target at the same time.
And it's quite lucky they did that - because it could give some
pointers to who they might be.

Presumably there are people still around who were involved in
that trial, and know what happened. Beck might be dead, but the
"witness" would still be around, as would Beck's solicitor.

>>by a group of people or agency within the UK. Although
>>they have never presented their identity, you can draw
>>your own conclusions on that point. There aren't many
>>people with the technical resources and contacts in
>>society to make feasible the sort of deliberate attack
>>on an individual which is described in this article.
>
>There aren't _any_ as far as I am aware.

I'm afraid there are.

>>The most disturbing part of the whole episode is the
>>participation of British institutions and their members, fully
>>comprehending what they do, in what is an act of attempted
>>murder against a British citizen.

>
>The whole society, in fact. From the top to the bottom. They
>wouldn't be trying to tell you to kill yourself by any chance,
>would they?

You got it. I'm a popular guy.

>>After the trial Janner said that "now he knew what it felt like
>>to be a victim of Beck's"; but, it wasn't Beck who set up the
>>attempted character assassination on Janner; the fact that they
>>took a side-swipe with their verbatim repetition shows
>>where the real source is to be found.
>
>The newspapers?

Well, your guess is as good as mine. But what newspaper would
send a team after someone for five years? I don't think so,
somehow. Of course they could, but it wouldn't be in their
commercial interest.

You'd have to look at a corporate entity which would indulge in
activity of this type, and the nature of the contacts they have
narrows down the search.

>>The goons behind the molestation are lower than the paedophiles
>>they use to convey their propaganda - they use the same
>>strategy of covert abuse, but there is nobody to check their
>>actions, or to bring these criminals to justice.
>
>Ummm.. Janner is a Barrister, a journalist who writes on a wide
>variety of issues, and a long-standing Labour MP. If he's unjustly
>smeared, he's more that capable of setting the record straight.

Janner blamed Beck for the invention. He didn't say anything about
it having any other origin. Even had he suspected any other source,
he could hardly have pointed the finger without some evidence.

>You say that the media is making similar allegations about you in
>relation to this issue? So, you're accused of child abuse, amd
>the allegation was reported in the media, I assume.

I've been accused of many things although that wasn't one of them.
Most of them have been yelled in my face by people on the street
in London at some time or other. Bit difficult to misinterpret
when that happens.

>What exact;y are they saying about you? (Respond here please. I'm
>leaving the UK tomorrow, so I can't read e-mail.)

It changes with time. Every so often, they sing a new song;
so at one point the allegation was homosexuality, at another
is was low intelligence, then it degenerated into sexual abuse.

<snip>

>>They invaded my home with their bugs, they repeated what I
>>was saying in the privacy of my home, and they laughed that it
>>was "so funny", that I was impotent and could not even communicate
>>what was going on. Who did this? Our friends on BBC television,
>>our friends in ITN, last but not least our friends in Capital
>>Radio in London and on Radio 1.
>
>How do you know this? Just from what you hear on the radio?

I can't remember if this was mentioned in the "regular" posting,
but on a few occasions they set me up with people nearby to talk
about me, or more correctly, to talk about somebody who
(in their minds) "resembles" me, with actually naming me.

One such occasion was a coach trip to Europe in June 1992.
The "set up" comprised a guy talking to a vacant giggling female
about "this bloke", who was never named. Apparently "they"
(also never named) "found somebody from his school",
"they" "got" him at his house and at a neighbours, and at
a B&B where their target was for one night.

Apart from that, yeah, from "what I hear on the radio". And
from what I see on TV. (I wouldn't be doing my job as a
mentally ill person properly if the TV and radio weren't
talking to me, now, would I?)

>>Oh yeah, I can see it now. All of them banding together, in a united
>>effort against one man. So ITN, the BBC, and Capital all decide to sit
>>round the table and they come up with idea of breaking into someones
>>house, putting bugs everywhere, listening in to his conversation, and
>>shoving it out on the news everyday.
>
>But why would they do this? What possible reason would they have?

But why get at anybody? Victimisation is the pastime practised against
other people; as the scorpion said to the frog, "it's in my nature".

>Are you aware that what you describe is also a common symptom of people
>who are suffering from a psychiatric illness? Have you been to your
>doctor and told him about this? Did he prescribe any medication? Have
>you been taking it, or have you stopped?

Yes, Yes, and Yes respectively. Still taking it. Doing quite well actually.

>>This someone has nothing to do with
>>politics, or business, or entertainment, just an ordinary Joe Bloggs who
>>seems to be extremely paranoid.
>
>Usually a clinical symptom rather than proof of a conspiracy in such
>matters.

>>How did they do this? I'll give you an example. About a year ago,
>>I was listening to Chris Tarrant (Capital Radio DJ among other
>>pursuits) on his radio morning show, when he said, talking about

>>someone he didn't identify, "you know this bloke? he says we're
>>trying to kill him. We should be done for attempted manslaughter"
>>which mirrored something I had said a day or two before.
>>Now that got broadcast to the whole of London - if any recordings
>>are kept of the shows then it'll be there.
>
>And this is supposed to mean... what? Chris Tarrant is in on this plot
>to kill you? It sure sounds like a joke to me. When you start to get
>ill, the mind often makes connections that seem logical and lucid to
>you, but do not to the rest of the world. This is one of those connections.
>They are usually known as delusions.

This is the problem, and there doesn't seem to be any way around it.
If a clearly sane person reported this persecution, you might believe
him, but probably you'd tell him to go see a doctor to "verify his
sanity". If someone with the illness of which you could argue these
things to be symptomatic says these things, again, you might believe
him, but it would be unlikely - the easiest route is the one you are
taking in the above paragraph. The only way I can convince you of what
I am saying is by giving precise details of what, when, how - and for
most of that stuff is based solely on memory.

To prove it would require an admission from somebody, or else hard
proof in the shape of physical evidence such as tape recordings.
Of course, I don't have that.

>The idea of a "pattern", and the notion that if anyone could look
>through your eyes they would see the same thing is very indicative of
>the onset of a psychiatric illness. Schizophrenia and manic depression
>have similar symptoms. I'm not trying to be disrespectful here.
>This may be an illness and it can be managed by the use of medication.
>If it _isn't_ treated, it can lead to terrible tragic consequences.

I'm quite aware what the symptoms would be, and that the reality
corresponds to those symptoms.

But if anything, that is an argument which could convince you of
the truth of what I'm saying. If they deliberately set out to
simulate the symptoms of schizophrenia - in other words, if they
know through observation that their target is either suffering
from the illness, or is on the borderline and could be pushed in
with an appropriate stimulus, then they can feel safe in what
they do, since once you are registered as suffering from the
illness, people will assign less credibility to assertions that
persecution is based in reality.

That this can happen, and people collude by silence, is absolutely
horrifying. It is all the more horrifying that it can happen in a
country such as Britain which has no history of repression.
Perhaps its happening in the UK is due to the arrogant assumption
of moral superiority on the part of those in the media and others
involved - we won the last war and we can keep harping on about

German and Japanese war crimes, so we can do whatever we like and
we'll be right, up to and including destroying the lives of our
citizens (as long as we're not caught doing it).

>>That is the level it's at - basically they show they're listening
>>to what you're saying at home, they show they're listening to you
>>listening to them
>
>But why? And why you? Do you realize how much it would cost to keep
>one person under continuous surveillance for five years? Think about
>all the man/hours. Say they _just_ allocated a two man team and a
>supervisor. OK., Supervisor's salary, say, £30,000 a year. Two men,
>£20,000 a year each. But they'd need to work in shifts -- so it would
>be six men at £20,000 (which with on-costs would work out at more like
>£30,000 to the employer.)
>
>So, we're talking £30,000 x 6. £180,000. plus say, £40,000 for the
>supervisor. £220,000. Then you've got the hardware involved. And
>any transcription that needs doing. You don't think the 'Big Boss'
>would listen to hours and hours of tapes, do you.
>
>So, all in all, you couldn't actually do the job for much less than
>a quarter million a year. Over five years. What are you doing that makes
>it worth the while of the state to spend over one and a quarter million
>on you?

Those are pretty much the sort of calculations that went through my
head once I stopped to consider what it must be costing them to
run this little operation.

The partial answer is, there have been periods when the intensity has
been greater, and times when little has happened. In fact, for much
of 1993 and the first half of 1994, very little happened. Although
I don't think that was for reasons of money - if they can tap into
the taxpayer they're not going to be short of resources, are they?

The more complete answer is in the enormity of what they're doing.
When countries kill their own people, as a rule, they get found
out and all hell breaks loose. This isn't some para shooting
Irish teenagers in the back. This is something which permeates
English society, which they are ALL responsible for, and which
they cannot escape responsibility for.

Relative to the cost to British pride of seeing their country
humiliated for the persecution of their own defenceless citizens,
isn't is worth the cost of four or five people to try to bring
things to a close in the manner they would wish? To the
government a million or two is quite honestly nothing - if they
can convince themselves of the necessity of what they're doing,
money is not going to be the limiting factor.

>>What possible reason? I guess because they think it's amusing to do
>>so.
>
>What? Spend a quarter mil. a year to amuse themselves? And why not
>change every now and again? Why keep watching you? (Unless you _are_
>doing something, and I don't think you are, though you may have some
>deep, dark secret in your past.)

See the above.

==========

>>I'm going to try to rationalise what you're telling us. I can think of three
>>possible explanations for what you are experiencing.

>>Another possibility is that you are developing some kind of paranoia. There's
>>no stigma attached to this; we're all paranoid to some extent, although
>>perhaps not to the extent that a doctor would call us paranoid. I think
>>paranoia is quite a straightforward explanation here - you really do believe
>>that all these things are aimed at you; you see people everywhere trying to
>>get at you. Logic suggests that this cannot really be the case.

>I think the evidence leans towards this explanation myself. Why not
>try soc.support.depression and see what some of the people there have
>to say about this? Just to get some more perspective on your perspective,
>so to speak?

Sure, it "leans" towards it. But please at least admit there is a
POSSIBILITY of it being very real. And once you've done that, can
you come up with some thoughts on methods of proof? I may be missing something
in my assessment - there may be a way of proving it, in the face of non-
cooperation from the "players".

>Hmmm, strange eh.
>I mentioned all this goings on to my boyfriend, who works for the
>British intelligence service, and he assures me this sort of thing
>never goes on.. not ever...honest.
>Though he said the name was familiar...

it does go on, although it's an open question who does it.

Some time ago there were press reports of an Army intelligence person called Jones who claimed Diana and Hewitt had been photographed in a compromising position... he said he'd been doing this as part of an Army unit which had previously operated in Northern Ireland.

Then Hewitt said he'd been told the same thing by some Army people, and that they were threatening to release the tapes unless they curtailed their liaison... as per usual everyone denied everything, painted Jones as the "Jones twins" - not very original in how they deal with their perceived enemies, are they?

You have to wonder how they manage to achieve this sort of surveillance though. Audio you can understand, it's possible to put a microphone through the wall, and apparently there exist devices which will retrieve sound from a laser beam bounced off a window - sounds sci-fi, but there's a well known surveillance electronics company in London which sells these things.

But how would you get video out of a room, unless you had actual physical access in order to plant a device for pickup? We're not talking about looking in from afar, but an actual device within the room. You could either drill through the wall and shove a pickup through; or you could supply a trojan device with a hidden pickup inside; but most likely, you would have to physically break into your target room to plant a camera. That's not an infeasible option; all it means is having your target(s) watched to make sure they're not in the vicinity, then you negotiate any locks on the property and find a suitable receptacle for your device.

The next question is how they defeat the usual methods of counter-surveillance. We had private detectives carry out a "sweep" of every room and the telephone line. They found nothing. That indicates at least four possibilities that I can think of; (this is all guesswork BTW, and probably fanciful guesswork at that!)

1) no bugs (pull the other one)

2) radio-transmitting devices which can be controlled from an external source, ie you can instruct them to switch off when you detect a counter-surveillance sweep taking place

3) hard-wired devices; probe microphones or whatever they're called, things you poke through the wall

4) passive surveillance devices; so you bounce laser or radio waves off a suitable reflecting surface (again, sounds far-fetched but such things may apparently exist).

5) there is a fifth possibility, that the PI's didn't detect an actual transmitting device; there are technologies specifically designed to avoid detection, eg frequency hopping and suchlike. But how much sophistication could you build in to a device which would have to be small enough to be physically concealable?

I guess the real question is to find out who is ultimately behind these "goings on". And if the "great and good" (or the better known, at any rate) can't protect themselves, what hope is there for the rest of us?

Yep :-) Its been a few years. I guess the text adventure thread
jolted me in to nostalgia mode.

Anyway, if memory serves, games made with the quill are somewhat
backward compatable with the A8 Adventure Writer. It wouldn't take much
to create a utility to convert the many dozens of Quill games over. That
might be kind of cool, to release 40 or 50 new text adventure games for
the A8.

Thanks for providing that link! Now that I see the ad, I also remember
the product. Never owned it, though. It would be cool to hear recorded
speech from it.

Anders

227. Auction:Tektronix422 Oscilloscope and alignment disk

Hey all! I've put my old oscilloscope and alignment disk up on Ebay. I need
the cash! This pair is great for aligning those old 5.25" disk drives.
Check 'em out!
http://tinyurl.com/34dh47

Thanks!
Momo

Due to having nothing better to do (currently looking for work), have made slight update to my Windows ATASCII file viewer, so it now supports the international character set as well as the graphical one.

Posting-Frequency: 7 days
Last-modified: January 21, 2007

Welcome to the comp.sys.atari.8bit newsgroup!
Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE Game System.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986, as part of the Great
Renaming, as a direct replacement for net.micro.atari8.

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

From: FujiMan <Rory.A.McMahon@gmail.com>
Message-ID: <1170190661.429082.191770@a75g2000cwd.googlegroups.com>
Source record: 5166

Hi,

I was wondering if there should be a section for 8 bit sightings in tv or video.

I found a 1200xl in this 80's music video for Donny Iris (Ah! Leah! fame) video called 'Do You Compute'

http://www.youtube.com/watch?v=uIN5q96-w4s

Its a hilarious low budget video, but shows some text modes of the Atari Computer. Slightly catchy tune too.

Any more sightings for 8 bit stuff?

Rory

Hehe, whats in the SEX.DO file on the 102? lol....
Nice stuff, I hope that's a reflection of a tree in the 102's screen and not
some kind of deformity. Good luck!

No...their company bio says that they were founded 7 years ago.

I did a little digging, and it appears that Suncom continued to make joysticks up until ~2001 or so, when they got bought out by another company. Their website (which was www.suncominc.com) and employees subsequently disappeared, and I see no retailers still selling their products. Looks like they're gone for good. Too bad....I absolutely loved the TAC-2 controllers.

Drac 030 has a Atari 65XE with running 65816, includig a patched XL OS to
support the 65816, and lot information on this on his homepage

http://drac030.krap.pl/en-main.php

I can only tell about the Atari Bit Byter User Club, around 380 Members
(mostly in Germany, Austria, Switzerland, Netherlands, some in the US).

ABBUC is publishing a quarterly Magazine (30 Pages print in colour and 2 MD
Sites Diskmag), and two "special" magazines each year.

As the mag is in german language, we're looking for volunteers to help us
translating parts of the mag for the english atari 8bit community.

see http://www.abbuc.de/index.php?newlang=english
for more information

2006.12.31 preamble, update my email address
2006.12.14 Radek Sterba, Raster Music Tracker (RMT) v1.25
2006.12.10 More Than Games, "SPEEDIER:" 19.2K RS232 adapter

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no

guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Hey All!!! If you even remember me??? LOL

First of all, to answer your question....

I don't consider myself to be an actual active member of the 8-bit community... but I DO maintain a strong interest in 8-bits as well as 2600 and also several of the classic systems of that era. I have faded in and out of the newsgroup over the last several years BUT, as I said, I DO maintain a strong interest in this system!

(Re)-Intro of myself...

I am known on the net as Nite Hacker and you can find me at yahoo using the handle and add 38 to it. For obvious reasons, I am not going to post a direct-link here and/or mention my real name! A FEW of you, if you are still around, may already know or remember me... BUT I have a strong feeling that MOST of the ones who knew me are NO longer around here!!! :-(

I started 8-bitting around 84 with a Vic-20 and then about 2-3 years later, I graduated to an 800XL system. I eventually joined an 8-bit group, NWPAC, which at that time Dale Wooster (previously well-known in the 8-bit community) was president and which eventually folded a few years later (circa 1998?). I don't remember as it's been so long ago now!

However, I had bought an 8-bit BBS setup and had started operating it myself (circa 1996?). I had previously been logging onto other bbses aka Super MarioBros, MarioBros and Nite Hacker. I ran the Iron Horse BBS for about a year and 1/2 or so until it had a fatal crash as Nite Hacker. During that time, the PAUGS BBS (ran by the NWPAC user group) also went out of service and ALL the equipment and stuff was handed over to me at that time as they wanted me to host their BBS on mine until it crashed.

It is with VERY sad regret that I have since lost ALL of my 8-bit stuff including the Iron Horse and PAUGS bbs when my storage unit, which I couldn't keep up the fees on it, was sold at auction.

I wonder if whoever bought it actually knows what they got!!!

I really regret it now since ALOT of the history of these 2 bbses may ALL be just a vapor now!!! ;-(

Nite Hacker

A lot would depend on what you call 'active'.

Daily use?

Occasional use?

"the come out of the box every so often just to play"?

I'm in the occasional use. My 256k XL is hooked up, and I've bought several of the cool toys from Atarimax. I just wish I had more time to play around with it!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE Game System.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board (B8MB): http://www.big-8.org/

Atari 800 parts received...

RTDos wanted me to post a message that I got the Atari 800 parts that he had advertised to ship to some happy home.

Now if anyone is interested in some of these parts, let me know and maybe we can work something out. drclu@swbell.net. Mention Atari in the subject line. ;)

Man sorry to hear that. I had a friend that was about to loose a storage unit and he made sure to pass along the Atari stuff before he let it go. We might have even broke into the unit. :D Looking back I think we might have an he didn't let me know. Yahhh...

Well, as for how many Atari users still exist in the world, I'd sayyy... Hmmm... maybe in the 500-600 range that have the Atari's setup on a desk that they play games on, program, call BBS's with. Or at least sit on a desk.

Probably at least 5,000 that have an Atari computer that they hook up a few times a year to play games.

And many more thousands that have Atari's in a garage or attic with the intent to do SOMETHING with that old Atari computer one day...

Hi,

I think I found a forum with alot of wisdom about Atari.
Maybe you can help me with a question from a quiz.
I'd like to know how many gametitles were released for Atari's 8-bit
gameconsole?
I got four choices: more then 90, more then 900, more then 9000 or more then
90,000?
Anybody who can help me with the right answer?

thanx

Paul

According to this wikipedia entry

http://en.wikipedia.org/wiki/Commodore_64

circa 10,000 games were released for the C64.

My answer to your question is that more than 900 were released for
the Atari 8-bit series.

I say that looks correct. The C64 had a bit more games than the Atari 8-bit, but it certainly more than 900.

GameBase64 has around 19000 games ready for download for the C64.
```

Which does not change my conclusion that more than 900, but less than
9,000, were release for the Atari. I mean, for the great Atari. The great
Atari that we all remember as the finest home computer ever made. Well,
at least we fujilogo worshipper think so.

It's a funny question. more than 9000, probably
not more than 90,000. However, there could be
more than 90,000. I have three compilations,
the CTH archive, Holmes archives and another.
If you count all the BASIC games that appeared
in magazines and from user groups, US, UK, Germany, Czech Republic, all
over, then probably approaches 50,000.
I've been around the Atari 8-bit for many years, and I'm still finding BASIC
games, pretty decent ones, that I never saw before (mostly from Europe now.)
My personal archives are on about 5 CDs, about 500 megs each, many repeats,
many in .zip files and megaimages.
If you're talking commercial games like MULE, infocom, Pacman, Missle
Command, then maybe less than 9,000, but certainly more than 900.

I am proud to announce that I have managed to prepare patched oo2c/
libraries to work with cc65 c compiler for 6502.

That means, now it is possible to write and crosscompile Oberon-2
sources for Oric, Apple, and other 6502 platforms
Work will be published soon, but there is still some work to prepare
reasonable standard library

limitations: cc65 doesn't support float, i. e. no Oberon REAL,
LONGREAL support.
no garbage collection

if anyone wish to help with writing libraries(using c, cc65 in-line
assembly, and Oberon) please, feel free to write me

I want to say that it is a real pleasure to write object oriented code
for my favourite little Atmos :)
regards

Norayr Chilingaryan

I have an 800 with the older version of the OS board. The older version has the necessary chips to use a standard 6502B and functions just fine with the 65C02.

People that have been around here a while have heard me whine about the lack of a 65802. Tried for years to find one w/o any luck.

Not sure why but it never occurred to me that the 65C816 comes in a 40 pin DIP. I'm cruizing eBay for one reason or another so I look for 65C816 and a couple pop up. Opening bid is 99ï¿½ but $10 shipping and handling! Ouch! I put in a hefty bid anyway and am awaiting the end of the auction.

I figure since I know the 65C02 works and have been told the 65802 would work if I can buy one, the 65C816 should work as long as I don't do anything with the extending addressing modes. I've wanted a 65C816 for a couple of decades now, looks like I finally get one.

I cruize over to the WDC web site and sure enough, not only are they still being made but the price is only $9.06! I bid on the eBay one because I thought they had discontinued the 40 pin DIP! I seem to recall last time I checked they wanted a fair but price for a single quantities. Something lost in the ozone of s senior momment like the only way to get single quanties was to buy a ~$75 developer kit that came with a single processor.

All comes to he who waits.

Rick

according to http://ooc.sourceforge.net/,

Oberon-2 is a programming language. What computers
was it available for?

oo2C is an Oberon2 (oo) language to C (2c) language
converter..

it converts Oberon2 to cc65 compatible C code..

What are the advantages of the language?

> Oberon-2 is a programming language. What computers
> was it available for?
It was originally written for Ceres workstations at ETH to develop an
operating system.
That was a microkernel os with many advanced features like garbage
collection and dynamic module loading.
Original os and compiler had approx 200 kb in size. Compiler
recompiled itself in approx 25 seconds on a 20 mhz cpu.
More information you could find at http://www.oberon.ethz.ch
> oo2C is an Oberon2 (oo) language to C (2c) language
> converter..
No, to be precise, oo2c is an Oberon-2 compiler. Its frontend
generates abstract syntax tree.
oo2c developers decided instead of writing backends for many different
cpu's and architectures write one backend, which translates
intermediate representation into not readable, highly optimized c
code.
Thus c is used as a kind of portable assembler.
That is why If you look at the c code it generates, you will find it
very similar to assembly language.

> it converts Oberon2 to cc65 compatible C code..
See above, not converts, but generates from an intermediate
representation. The work have been done to adapt it to 8 bit cpu's
and to compile minilib (originally designed by Stewar Greenhill for
avr microcontrollers) with cc65, instead of gcc.
It was not easy task :) gcc and cc65 is very different.
> What are the advantages of the language?
Oberon is a successor of Pascal and Modula-2, it is much simpler, but
more powerful.
Language is object oriented, strong typed, modular with
_type_checking_across_module_boundaries_
garbage collection yet not supported in 6502 version

Is it reasonably easy to compensate for the lack of garbage collection
by following a certain programming style? Or how do you manage it.

Anders

280. OT : Winzip problem?

Newsgroup: comp.sys.atari.8bit

I don't know why, but when I try to download from Internet (in this case Atarimania.com) the winzip program opens the file, not asking if I want to save it or open it. It did this before, but I recently installed a new version of Winzip (11 I think). Anybody know if there's an option to turn this on or off?

Thanks and take Atarian care

Don't know which version Windows you got.
But you, at some point, have answered "Yes" to
Winzip's question "Do you want to make Winzip the
default for this file type?"
You've established Winzip as the 'opener' for .zip
files.
You need (in Win98SE) to 'My Computer', then
in the 'Files' tab on top, select 'File Types', then
open that and find .zip files and Remove that file type
from the list.
Next time WinZip asks if you want to make it default,
say 'No' and even click a 'don't ask again' if there is
that box.
File associations work similarly in XP.

Then again, WinZip probably has a 'configure' option,
and that may have a 'automatically open archives' or
some like, as well as file extensions to associate with
WinZip. I use PowerArchiver and it has that.

```
Third idea.
Winzip maybe isn't extracting the files from the .zip,
just showing the files, and you have to tell it to
extract and where separately.
```

284. January 07 winners/Feb 07 prizes

Greetings everyone!

Here are the lucky and the proud winner(s) of the January prize(s) at The DarkForce! BBS:

January 2007
1. ST Magazine - Teklord wins the free 3 mag. subscription

2. Mega STe motherboard- Guitarman61 wins it!

Congratulations to our winner(s)!

Also, here is Februarys prize:

February 2007
1. ST Magazine - some lucky Atari caller will win a free 3 magazine subscription.

2. We just had the SuperBowl here in the US, so lets play football! AFL Football that is! The winner of AFL Football this month will pocket a $25.00 cash prize. (please read the docs fully, you must play to win).

Congratulations to our winners, and good luck to this months callers!

:)

That is what it does. Not saving, but opening the zip file. Didn't do that before and I have always answered yes to make it default for those type of files. I think this must have been happening in version 11. Didn't do it in 8. I use W2K and XP by the way, boots default to W2K, but installed XP because of some programs that only run on XP.

Thanks for the ideas and tips though!

What browser are you using? I know this an option in
firefox, and I'm reasonably certain this also an option
in IE 6 & 7. You'll have to poke around the options for
either, because WinZip is getting invoked by the browser.

HTH,
Tarkin

> recently installed Winzip 11, so I figured that was the reason!

Oh, you're most welcome!

I would check both. I've stuck with Winzip 8,
as I've enver had problems w/ it and don't
need to create archives that much; when I do,
I make gzipped tar archives on Cygwin or
Linux, as the system/boot partition dictates :^)

So, you may want to check both the WinZip
and IE6 preferences.

TTFN,
Tarkin

It isn't a problem with OS itself but the actual construction of the
OS/personality board. The early revision boards just used a standard

6502B chip with ~2 support chips to allow ANTIC to interrupt/DMA<or something>. The functionality in those chips was later added to the 6502C which is why we are incompatible with stock 6502's.

I am really a rank newb when it comes to the 65816. I figure I will start off just seeing if it works and if it does, rewrite some of the Action! PD runtime library. In my tests on the 65C02 I got ~5% smaller code and 5-7% faster execution. I think the '816 has a slightly richer instruction set in 6502 mode so it should do even better.

And *IF* it does not crash in 65816 mode, they have instructions like block move that should be hugely faster then 6502 move loops.

Rick

Rick, Larry:

I have some experience with the 65816 running in an Atari (my memory-upgraded but otherwise stock 800XL). It was the FTe '816 module, which dropped directly into the 6502 socket, and worked quite well (it was more than merely plugging a 65816 into a 6502 socket). I used John Harris' excellent macro assembler editor package (name escapes me) and the book "Programming the 65816".

I did manage to create a version of my APACVIEW GIF decoding program for the '816. Here's what I remember:

- The chip powers up in 8-bit mode, and all your old programs work just fine in that mode. They will not run any faster.
- You switch the '816 in and out of 16-bit mode programmatically. Your O/S will probably crash the first time you do this, as no provision for 16-bit interrupt servicing existed in the O/S ROM. So you have to disable _all_ interrupts. Curiously, normal display operation is possible without VBI (but no funny DLI-based display modes will work).
- I only got a 15% improvement in coding a GIF decoder over my 8-bit version. I turned off interrupts, switched to 16-bit mode, and decoded the entire image, then switched back to 8-bit and enabled interrupts. Not enough of my routines needed 16-bit access capability, apparently.
- Once you're in 16-bit mode, all writes and reads are in 16-bit mode. I don't remember getting around this for times I only needed 8-bit writes/reads.
- The '816 instruction set is not much richer, in my memory, other than having the ability to write/read in 16-bit words (I never used the block move instructions). They did lock out certain "trick" 6502 modes that were oversights in the original design (but exploited by some programmers). The '816 does fix the 6502's errors w.r.t. running in BCD mode, then getting interrupted and losing the status of the BCD mode bit (my memory is fuzzy here).

Don't ask me to send you my 800XL, I'd given it away years ago...

Your eight-bit friend,

Jeff Potter

Hi folks,

does anybody here know the pinout of the ProSystem interface cable that allows users to connect an Atari style disk drive to PC hardware?

I had the impression that this is just a standard 12V-RS232 to 5V SIO level converter that maps the DTR line on the RS232 side to the command line on the Atari side, but I've a user here that doesn't seem to be able to use it with my software (atari++). As I don't have this interface, probably someone's able to give me a clue.

I'm using the following to set the command line on the ProSystem cable:

RTS is always enabled, and DTR just mirrors the state of the command line. If DTR is active, then the command line is "pulled", i.e. devices are expected to receive a command frame.

So long,
Thomas

Hi Rick and Jeff-

Thanks for the info. I was mainly curious about the 800 OS board,
although I don't use one anymore.
I'm mainly a fan of XE's, and there are three different accelerators
in the works for the XL and XE. Of the three, two use 65C816's.
Surely one will pan out!
I still have my 65816 "Bible," patiently waiting...

-Larry

You can get the original description from the APE for DOS docs which
is available from the atarimax website (the pro118.doc file inside
the ape118d.zip).

Basically it works like this: RTS is used as a power supply for the
circuit (RTS is set to logical false, the RTS line on the PC then is
at +9-12V, a zener-diode is used to convert that into +5V). +5V is
also connected to the SIO +5V/ready pin, otherwise disk drives won't
accept commands from the SIO bus.

RxD, TxD and DTR run through the 14C89 and connect to RxD, TxD and
Command of the SIO bus.

The really bad thing about the ProSystem interface is that it doesn't
conform to the RS232 standard and therefore isn't compatible with all
RS232 interfaces. Just consider it as a really ugly hack.

The interface itself doesn't provide negative voltages to the RxD input
of the PC and therefore relies on the fact that the interface interprets
the (illegal) input of 0V as logical true (the 14C89 is a RS232->TTL
converter, not a TTL->RS232!).

Basically, all onboard PC serial ports work with this hack, but none
of my RS232 addon boards (ISA and PCI) worked. The RS232 spec clearly
mentions that voltages between -3V and +3V are unspecified, you need
at least -3V for logical true (usually -12..-9V).

HTH,

Hias

Here we go again. Have you ever read the actual RS232 standard or are
you just repeating something you heard? I don't mean some faux engineers
web page or newsgroup post, but the actual technical specifications? I
can say with 100% conficence you are wrong in your assumptions.

Sorry, I don't have access to the original EIA/TIA-232-x specifications.
But the +/- 3V gap is also mentioned in the ITU-T V.28
specification plus almost every appnote you can find on the net.

V.28 spec : http://www.itu.int/rec/T-REC-V.28/en
Dallas/Maxim appnote : http://pdfserv.maxim-ic.com/en/an/AN83.pdf

If I really shoud be mistaken, please point me to the right direction.

so long,

The net references, and I have seen dozens, are all wrong on several
levels, mostly by ommision. The full spec calls for the +/- 3V *AND*
recognizing 300 Ohms to ground, => 0 volts, as a logic 1. To not
recognize it would to not be in compliance with the FULL specification.

I believe you can find some good details in

Microprocessor Applications Manual ISBN 0-07-043527-8 copyright 1975

Further, been a while since I read it, I think this is the reference
where the designers of the 6800 and 1489 talk about deciding to use ttl
levels for the switching point of the 1489 just so people *COULD* use
ttl level logic to interface with it. Kind of statement like 'since
range -/+ 3V is undefined and we want to make the 300 Ohm to ground
work, this is what we did" in the text. It is designed to switch at ~.8
volts rather then -3V. This is the chip used in the IBMs and in fact is
the designers made it to work with ttl levels. They don't suggest it,
they don't hint it, they explicitly say that is what they did to make it
fit the specifications and be easy to use.

Even the Radio Shack Semiconductor Reference Guide has the full specs in
it. I have it open to the page in my 1985 edition right now. I seem to
recall they included the specs with the little reference sheet when you
bought the chip too but I haven't bought one from them in a decade so it
may have changed. In any case they included an equivalent circuit in
both docs that show the input is protected by a diode. Anything you put
on the input below the forward voltage of the diode ~.6 volts, will not
be seen by the rest of the chip anyway.
>
> V.28 spec : http://www.itu.int/rec/T-REC-V.28/en
> Dallas/Maxim appnote : http://pdfserv.maxim-ic.com/en/an/AN83.pdf

They have it via Clause 7 of the docs. Option to interpret as fault or logic 1 and is universally interpreted as a logic 1 by everything I have seen. It is stated much clearer in the Motorola docs.

First of all, really thanks a lot for your verbose explanation!

But, currently, I can't agree 100% with you. I know about the most
common receiver implementations (most have a threshold at about
+0.8..+1.6V) but this hasn't to do too much with the standard.

The V.28 spec mentions that the sender (generator) "shall" output at most
-5V (-15..-5V) or at least +5V (+5V..+15V). The ProSystem interface
doesn't meet this spec (clause 4).

Next thing, the clause 7 is about fault conditions and also says that
a receiver "may" interpret an undefined signal level as logical high.

This all together lead me to the conclusion that the ProSystem cable is
more a (bad) hack then a well-designed circuit. Just consider using
such a device (which will output slightly above 0V and slightly below
+5V) together with a 1-2m cable. It's far from fault-tolerant, even
if the receiver threshold is somewhere between +0.5 and +1.6V).

Please don't get me wrong. I've experienced a lot of problems with
those (14C89) ProSystem cables with add-on RS232 cards and I'd really
like to know what's the exact cause. My first thought was "they don't
even output +/-3V, I guess that's the reason".

BTW: All of those cards worked fine with a MAX232(A) interface.

But maybe it's really something else that hasn't to do with signal
levels, eg the 14C89 drawing too much current from the RTS line
(which, then, would also be a violation of the specs...).

so long,

Hias

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE Game System.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board (B8MB): http://www.big-8.org/

RELATED USENET NEWSGROUPS

Ok, thanks, that's what I'm doing: Putting a LOW on the RTS (so a +12V
on the actual RS232 lines) and CMD on DTR. So either we have an
incompatible serial port that is picky about the specs, or a timing
problem concerning the serial interface. The system were this doesn't
seem to work runs winXP, I've tested the timing with a null-modem cable
and your Atari SIO server (thanks!) on Linux and Win2000, so I *would*
believe the timing is fine as it is. Of course, on a heavily loaded
system and a program running only in user space, all bets are off. (On
Linux, we have your AtariSIO kernel driver, but not on WinXP.)

Hmm. The typical 1488/1489 RS232 interface chips accept this as "true"
according to the specs I have. Whether this is conforming to RS232 I
don't know.

> > And *IF* it does not crash in 65816 mode,

It will. You need to replace the OS in order to use the 16-bit mode
with interrupts enabled. I'd recommend to use my 65C816 version of the
XL OS downloadable here: http://drac030.krap.pl/en-pliki.php

> > they have instructions like
> > block move that should be hugely faster then 6502 move loops.

The move block instruction, although it is really much faster than a
simple loop, it not so fast as it coul be. It transfers one byte per 7
clock cycles.

> I used John
> Harris' excellent macro assembler editor package (name escapes me)

It is MAE. Excellent assembler indeed, although versions later than
1.1 tend to be buggy.

> - I only got a 15% improvement in coding a GIF decoder over my 8-bit
> version.

Depending on the task to do, using the 16-bit instruction you can gain
up to 30% at the same clock speed, compared to standard 6502. Surely
this is a maximum - there are tasks where you can get less, or even
none.

>From my experience, 65C816 requires slightly different programming
techniques than 6502, and it is quite difficult sometimes for an
experienced 6502 coder to change the mind and learn/invent new tricks,
or at least avoid applying "old" methods when writing programs.

> - Once you're in 16-bit mode, all writes and reads are in 16-bit mode.

Not true. Once you're in the native 65C816 mode, you *can* use 16-bit
reads and writes, but you're not obliged to do that.

> - The '816 instruction set is not much richer, in my memory, other than
> having the ability to write/read in 16-bit words (I never used the block
> move instructions).

The instruction set is mostly enriched by new addressing modes (there
is 22 of them).

Thanks for the link! Unfortunately the computer I have that should be
65816 compatible is an 800 so I don't think an XL OS will work. I will
take a look at your OS as it will help me figure out how to rewrite the
800 OS.

I don't know if you are familiar with the Action! language or its run
time, but it would be fairly easy for me to disable interrupts on entry
to any routine using 65816 instructions.

There were so many things that just needed a small speed up to be
practical, it would probably be enough. Screen scrolling with terminal
and word processor programs, serial communications, and animations to
name a few.

I'm not going to tackle an OS rewrite, but even old programs like
miniterm were written in BASIC and could barely keep up at 300 BAUD. I
remember just changing my OS to fast floating point routines was enough
to make make miniterm work reliably.

Point being that IBM may and does. That is the RS232 implementation
follows clause 7 by design and is stated as such.

Logical construct thing. You may go to the store and buy a liter of
milk. If you go to the store and buy a liter of milk, then it becomes a
fact.

If someone uses the cable on equipment where clause 7 isn't implemented,
then right. i.e. No one went to the store so there isn't a liter of milk
in the fridge.

I can't remember his name, ~JT131 from Poland I think, sold SIO2PC interface cables on eBay. I don't have a break down of his sales but I seem to recall he had something like 2,700 positive feedbacks. I think he may have had one negative feedback but its been a long time since I looked. Like I said, I don't have the details but it does look like his cables worked for 99.96% of the IBM compatibles and possibly 100% since you are bound to get a complainer in 2,700 sales. These were SIO2PC cables but they still do the ~.6 volt as logic 1 and ~2.4 to 5 volt as logic 0.

I am mostly mentally stable with the exception of the occasional fits of obsession.

Specifically ~CMOS switches to become a low value resistor of a few Ohms as compared to silicon which is mostly current source or sink with a forward voltage drop.

A few years back after one of these RS232 debates/Pro cables don't work, I rewired one of my socketted 14C89 SIO2PC cables into a Pro cable. The cable worked fine of course but since Steve specifies the 14C89 I decided to plug in a plain old 1489: It worked too although chip voltage levels and positive output voltage was down to ~2.4 volts. I test everything to the detriment of my free time.<grin>

Actually that was the last time I had an Atari plugged in.

Surely it won't - it needs the 16k ROM space available in XL/XE
machines.

Way cool. I've been using Oberon for a while, have tried oo2c a few years ago (without patching it) and thought again about it last week when reading "The School of Niklaus Wirth: The Art of Simplicity". Now it is done, thank you very much!

Carsten

We are talking about different things. I don't doubt that your interface
works in some 99.something% of the cases. And I also don't doubt that
99.something% of the RS232 receivers are implemented in the way you
described.

I re-read the specs several times and thought about all this quite
a lot the last days. I have to admit that some of my conclusions
that I made in my first post aren't 100% accurate, but my basic
point (your interface being out of spec) still stands. And I think
now I know why it fails in some cases:

The original RS232 specifications were designed with a simple
principle in mind: reliability of an unbalanced connection.

The sender has to output at least +/-5V. The receiver has to
detect a signal of at least +/-3V. And, as a last fallback,
we have clause 7 (V.24 even says that this kind of fault handling
must be implemented for modem control lines - though it's not mandatory
for the RxD line, let's just assume RxD works the same way since in
most of the cases identical line receivers will be used for all inputs).

While a standard-conforming sender has a quite big safety region,
at least 2V without clause 7 and 6V for negative signals / 4V
for positive signals (with clause 7, assuming a switching point
of +1V), the ProSystem cable has a safety region of only ~0.5-1V.

And this reduced safety region will be a showstopper if we don't
have ideal conditions. Just think about interference, cross-talk,
ground-loops, a slight DC offset, ... We just don't live in
a perfect world.

During the last years I read approx. one posting per year
(here in this newsgroup and in web-forums) from someone having
problem with the ProSystem cable. Using a MAX232 based cable

always solved the issues.

You might say that this is not a lot, but for each individual
who experienced the problem it meant quite some time of frustration
tracking down the problem plus also a financial loss of some
10-20 EUR (or whatever they payed for the interface). And this
is one of the reasons why I don't recommend 14C89 based interfaces.

so long,

Hias

I think it's joystick. Push back on the stick to get a wall in front of you
I think. Don't remember, long time ago, so might be confusing with other
game. Shoot through the opponents wall and I think you shall hit him?

If I have it right, clause 7 is in there so you could tell if a
receiving device is off. It was also there because some of the early
equipment used relays but that isn't the relevant point for this topic.

We are going to have to agree to disagree.

The topic is RS232 compatibility with the IBM, a clause 7 implementation
of RS232. If you really want to pull out the rule book, there is no Ring
Indicator in the RS232 standard ergo Nick's MAX232 version of the cable
and software is not RS232 compliant. AH! but there is in the IBM
implementation. If you want to say not all implementations of the RS232
standard follow clause 7, fine. If you want to say there are some after
market boards that don't follow the full RS232 standard w/clause 7,
fine but I would like to see an example.

In looking for a 1489 equivalent schematic I happened on a Mac site:
http://www.mactech.com/articles/mactech/Vol.01/01.08/SerialPortsasSlots/index.html

"The receivers do not operate in strict accordance with RS-232, since
their input switching threshold is around +1 volt. Therefore these
receivers will correctly respond not only to RS-232 input levels, but

TTL level inputs also. Like the drivers, the output is inverted from the input."

I think this is the only site I have seen where they say where the 1489 switches. They did forget to mention clause 7 though.<sigh>

I take slight exception to their "do not operate in strict accordance with RS-232" A specification says what something should do, i.e. treat -3V as logic one and +3V as logic 0 which the Mac complies fully with. To use their reasoning everything that switches in the undefined(ignoring clause 7) "do not operate in strict accordance with RS-232" Of course everything switches somewhere between -3V and +3V!!! It is an engineering/design decision to decide where and at your discretion. If you choose to switch at 0V or +2V or -1V you are still in accordance with RS-232 standard.

I found the 1489 schematic.
http://www.onsemi.com/pub/Collateral/MC1489-D.PDF

Look at the input stage. Pay particular attention to the 3.8k resistor going to diode which is connected to ground. All the talk about -3 volts or -25 volts really doesn't make a difference to the circuit. Anything below the forward voltage of that diode is tits on a bull to use my father's expression. It is clamped the way the MPP joystick modem clamped their inputs except they used a zener to limit the high side voltage too. Very common way of doing things. I believe diode clamping like this is standard on just about every IC to protect against static discharge.
>

> always solved the issues.

This is WAY down from when 1489 SIO2PC/APE/Pro version cables became popular. Like I said about 70% of the people posting about SIO2PC were "This thing doesn't work."

I've offered to fix or exchange working cables to anyone who had trouble with either the 1489 or MAX. 100% of the problems I found were assembly. I stopped doing it when I put my 8 bit away maybe 5 years ago.

Just a side note, the 1489 stuff by everyone involved wasn't done to be perfect. The j131 or Tucker or Dyson or me or whoever were done because the people trying to make Nick's original MAX232 version couldn't do it. We are really talking first project, never seen a schematic type of person. I'm pretty sure that is why Steve puts up connection lists

rather then schematics. When I did a 4049 version people complained they couldn't find the chip. The MAX232 was even tougher to find and cost $6 back then. When I did the 74LS00 version I got a lot of "What's that?"s The best solution ended up being "Go to Radio Shack and buy a 1489." That some people still have trouble making them, bad parts find their way into assemblies, the occasional diode with too high a forward voltage, does not surprise me. I've even had new cable that had an internal break and at least one with an internal short. The manufacturing fallout is really quite low compared to just about any other electrical device.

This is an obtuse point, but stick with it please and it may make sense. I Nick said it best: I forgot his exact words. Something like, 'The first one you build is exciting. After you build 10 or more it just becomes boring work." He priced the ones he made to discourage people from ordering from him. Likewise Steve Tucker said something similar in that he enjoys programming but doesn't like soldering APE/Pro cables => another high pricer. I know I was toast after making/fixing a bunch.

That the price dropped and people were willing to make the 1489 versions was an unforeseen bonus.

Judging from several sources..sales, newsgroups, chats, other sites...
I'd estimate only about 50 active users in the US/Canada. Maybe a few
hundred more in the rest of the world.
Probably a couple 1000 in the garage, attic, or closet with plans of
being used.

I suspect there are more than that. There are probably 10 to 20 people lurking and just casually using them when they get the chance. The Atari scene is a victim of it's own success. With APE it's so damn easy to just download and go play with emulated drives that getting support in these forums isn't that much of an issue. I know I find it far easier to get stuff running on my Atari's than my Commodores or Apples.

Victim to its own success? I find that an interesting statement.

I think there might be 50 users in the US that actively USE the Atari 8-bits
say for anything business related or getting on the internet. I think there
are many other gamers and tinkers however. And those people step in and out of
active use all the time.

If it were not for chatting, Newsgroups, and BBS's, my Atari 800 would only be
occationally used. For me, computers have always been about communicating.
It's the interaction with other people that make a platform fun for me. ;)

I am going to purchase a Atari 2600 off or ebay for nostalgia reasons since I grew up on this. I have very limited space though and would love to share it with my computer on my VGA lcd monitor.
My question, can this be done? I know the monitor is very much overkill for it but is there an adaptor to adjust the output to this?

324. Dying 800XL

Newsgroup: comp.sys.atari.8bit
Date: 2007-02-17 18:16:31 UTC
From: Thomas Wellicome <tjw@zetnet.co.uk>
Message-ID: <45d74565$0$760$4c56ba96@master.news.zetnet.net>
Source record: 5007

Hi,

I've got a Atari 800XL, which I haven't used for about a year after I moved house, unfortunately when I got it going this weekend the machine started playing up. The problem (according to the memory test) is related to bad memory, with many of the memory areas not working all the time and one of the ROM chips working intermittently. However some of the time a lot of the chips do pass the memory test, it just seems to be when I load anything they fail. Often when I turn the machine on the self test has nearly all the chips working.. I've had a look inside and the chips appear to be soldered onto the motherboard, so they can't have come loose in their sockets. When the memory plays up the machine goes bananas with all sorts of nonsense appearing on the screen. Sometimes it just locks up and others the option/start switches don't work..
Also I noticed while the machine was open the plastic 'circuit' from the keyboard to the motherboard was badly discoloured between the keyboard and the connector. Could this cause the above symptoms?
So the question is what can I do about it, or failing that, if there is anyone out there in the south or south midlands of the UK who would be able to fix it (obviously would pay for it). I'd rather get it fixed than lob it as it was my first 8bit.

Thanks for any advice,

Thomas W.

You have a couple options. One option is to play the the computer through
your PC using a TV/video capture card. The other option, and the one I
use, is an external upscaler that will take your composite output (some
even do RF) and upconvert it to VGA. Most of these devices also have VGA
passthrough so you can switch between your PC and the Atari. See
http://www.avtoolbox.com/upconpage.shtml for some sample devices.

I forgot to mention as well that many Atari machines include chroma/luma
signals that will allow you to start with s-video output rather than RF or
composite. If you get an 800 or a 130XE, for example, you'll have these
signals and can buy or build yourself an s-video cable for better video
quality prior to upscaling.

See my reply to your 400/800 question for part of the answer. In addition,
since the 2600 does not inherently include a means to output anything but
RF output, you may need an intermediate step for doing that. As I
mentioned in the other post, some upscalers will handle RF, or you can use
an old VCR to do the conversion from RF to composite/s-video. There is
also a fairly simple modification you can buy for your 2600 that will give
you A/V output will little effort. Take a look at
http://www.8bitdomain.com/products.php?id=3 for details.

Thomas, I cannot give any advice about the techical problem. But
about your intention to fix this specific computer because it was
your first 8 bitter: I like that! I would do the same for my 600XL.

Anders

snip.
I'm not an expert, but here's what I'd do.
I'd unplug the keyboard and see if it will boot to READY.
Then, I'd get a second 800XL, (I already have several).
Then replace the Large 40 pin ICs one at a time with
known good ones, probably starting with the PIA and
POKEY, and assuming your LSIs are socketed. Also
try swapping the OS ROM, and I think there BASIC
ROM is separate. The idea being to swap chips, one
at a time, with known good ones.
Finally, maybe, get a logic probe and have the known
working XL and the problem one just the motherboard
and try comparing logic probe results between the computers. I you find a
big difference at one of the
chips, see if you can replace that chip.
Also, start with a known good power supply, again
using a second known working XL. Probably try
checking the PS first before the other ideas.
Or, hope someone who can fix it will respond.

Sadly I've only got one XL (and an 800 and 65XE), maybe I should invest
in another one!

> Then replace the Large 40 pin ICs one at a time with
> known good ones, probably starting with the PIA and
> POKEY, and assuming your LSIs are socketed.

As far as I can remember from my inspection of the motherboard there was
only one central socketed chip, the rest were soldered on motherboard.
My soldering skills are no way good enough to start unsoldering chips.. :(

Also
> try swapping the OS ROM, and I think there BASIC
> ROM is separate. The idea being to swap chips, one
> at a time, with known good ones.
> Finally, maybe, get a logic probe and have the known
> working XL and the problem one just the motherboard

Hhhmmm my slight problem with that one is that I have absolutely no idea
what a logic probe is (doh!). Is that like a voltage tester? (See why I
need someone else to fix it ;))

> Also, start with a known good power supply, again
> using a second known working XL. Probably try
> checking the PS first before the other ideas.
> Or, hope someone who can fix it will respond.

I've been using my 65XE power supply for it as I haven't managed to
track down the original in the stacks of boxes I've got lurking round
here.. it worked with the XE last time I checked, but that might have
been a while ago as well. I'll have to find the other one, didn't think
of that..

The memory test problems are entirely sporadic, I managed to get it to
pass all the memory test (getting the full 48 (or however many) green
lights for memory and the two green for ROM). I managed a few games of
Ork attack with no problems. I then reset and tried the 10 print "jimmy
is a twit", 20 goto 10, run. However it locked up during typing and is

back to sporadic behaviour again..

(snip other stuff)
OK, so it works sproadicly.
The power supply is easy enough to check, check it
on the 65XE. The 65XE is pretty much identical to
the 800XL, same chips, I think. Of course we're talking
UK models, which may be different from US ones.
A central socketed chip sounds quite different from
the five or six (hmm.. lemme see, Antic, GTIA, POKEY,
PIA, CPU, I think that's all) 40 pin LSIs.
So, you could use your 65XE as a comparison, if
you're willing to open up, unplug the keyboard, and
just work with the motherboards, and know which
chip is which, ... which is a problem, the CO numbers
on the chips indicate which is which.
A logic probe will tell you if the chip pin is HIGH,
LOW, or pulsing (digital).
Yes, check the PS first.

Thanks for the advice. I'm going to pick up a 2600 but not sure if
I'll get a 400 or 800. I'm just getting some of the computers from
that time, the Commodore 64, Apple II,etc. I'm going to do my best to
save space and share monitors. S-Video sounds like a great solution.

Thomas i've worked on quite a few of these and repaired many. If the self test indicates bad ram at points you always start there. Replace them with 4164 rams and I bet you'll be good to go. In fact, if you want to send it to me (i'm in the states) i'll repair it for you. But I strongly feel start with the RAM and most if not all your problems may go away.

Do any of the RAM chips feel very hot to the touch maybe? (don't burn
yourself!) They shouldn't heat up excessively during normal operation.
That's one way to check that might work easily for you. Another is to
replace them all, but on an 800XL they are probably all soldered and you
said you didn't want to start desoldering chips in another message.

Yeah, I AGREE... I would say there probably is more than just 50 in the US/Canada! Out of the 2, though, it's HARD to say who has more active users... BUT I think I would have to lean towards the US, though!

You DON'T see them ALL on the internet and/or the newsgroups! You WON'T find ALL the users left on the internet, etc... and you CAN'T base it on sales either!!!

I am SURE there are several who DON'T have access or don't want to get on the internet or even use a PC for that matter... or even have time to, for that matter! It's HARD to really estimate just how many are still interested in and/or have an 8-bit laying around the house... BUT I am sure it probably has to be more in the neighborhood of a few hundred or so... that ARE STILL interested in it!!! There are alot of them who are not interested anymore and are trying to sell their stuff or it's just sitting somewhere... a closet, attic, shed or storage. There is an ABUNDANCE of stuff to get, if you are looking for it! Ebay is a prime example of it! Yeah, there ARE some hard-to-find items, BUT if you look long enough, you will probably find it sooner or later! Based on Ebay and other sites or users, I would have to say there are MORE users than you have estimated! However, I don't think anyone can really quantify this... unless you included it on a Census questioniare form!!! LMAO

I suspect there are more than that. There are probably 10 to 20 people lurking and just casually using them when they get the chance. The Atari scene is a victim of it's own success. With APE it's so damn easy to just download and go play with emulated drives that getting support in these forums isn't that much of an issue. I know I find it far easier to get stuff running on my Atari's than my Commodores or Apples.

The standard VCS2600 only has RF output and no other video connectors.

Hi all thanks for your replies :)

I found the other power supply for my 800XL and tried that and seem to be getting better results, the memory check has been on for about two hours and none of the memory seems to have failed yet, so it might be it's a power supply issue, though I've had no problems with the power supply when I was using it on the XE. I hadn't noticed any excessive heat coming from the machine, which seems to stay quite cool, unlike the 800! The machine still locks up when I try and load anything from tape, though I haven't had chance to check the 1050 with it. That might be down to a datacorder issue though. The one I got with it is slowly dying, while two others I got with my 800 seem to be on the way out as well. I have been using another one, which is the XE style one, but that draws power through the SIO port so it might be causing an issue that way. I suspect my keyboard is slightly to blame in this as well as the XL is having issues with start and option being held down on boot up. So I think I need to find another datacorder, another power supply and maybe replace the keyboard (or at least the plastic circuit strip in the keyboard) and see whether the problem clears up. I think I might invest in another XL as well, just to be on the safe side ;)
Actually I was wondering what is going to happen when all the datacorders die, is there another way of getting a normal tape player to feed the Atari (I have got a SIO2PC, but never seemed to have much luck with it (it's got an old ST style serial port connector which is twice the size of the newer ones and attempts with a converter were unsuccessful)).

regards

Thomas

I think the idea is to shoot through the bricks and then shoot into the fuzzy stuff behind the opposing gun. Left and right move you like that though you can only stop by pulling back on the stick, which stops you dead. You can block the enemies missiles with the beams that come out of you when your moving left and right and also with the body of your gun (not with the gun itself though). If you shoot the enemy in the gun or he shoots you then they cannot fire for a bit. Hope this helps.

I've got a similar problem with my original 130XE. A few years ago I started getting problems with garbage on the screen and the memory self test consistently showed a bunch of bad RAM blocks.

Although I have a working 130XE, I'd really like to repair my original one since it was the 2nd computer I owned (the first being an 800), and it has a Ramrod board with Omnimon, Omniview, and the standard OS.

Is there any easy way to see which specific RAM chips are the problem? I might be able to replace one or two chips, but I doubt my chances are good at successfully replacing all 16 of them.... my soldering skills just aren't that good.

Thanks.

I would be willing to repair it for you. Keep in mind the 130XE has very
weak solder pads and traces and if you aren't skilled at
soldering/desoldering you risk damaging the board.

If your 130XE has the MT type RAM chips, these are notorious for failure and
they should ALL be replaced. Shoot me an e-mail if you'd like for me to fix
this for you.

I wish you the best. However I have seen many an Atari that will show an OK
ram test for hours. But the very next time you cold boot it you may have
RAM issues again. If it were a power supply issue, I would expect you to
see more consistent issues and/or complete failure.

Memory malfunctions may be a symptom rather than a cause.

I would replace any electrolytic capacitors, because these have the shortest life. They literally dry out over time. Silicon chips last far longer, especially if not used often.

> Also I noticed while the machine was open the plastic 'circuit' from the

> the connector. Could this cause the above symptoms?

No, it is just the printed conductors corroding, that would cause the keyboard to fail but not memory.

> So the question is what can I do about it

Stick a scope on the power rails and check they stay healthy looking. If they have big spike on them then it may well be the electrolytic decoupling caps have gone dry.

Yep, these have a big electrolytic cap and an inefficient linear power
supply getting hot and accelerating the cap-drying out.

In an ongoing effort to reduce the mass of my possessions, I replaced my
ancient heavy 5V 1.5A Atari PSU with a modern lightweight 5A switch-mode
PSU.

> datacorder issue though. The one I got with it is slowly dying, while two
> others I got with my 800 seem to be on the way out as well.

They are mechanical and will wear out faster than other kit.

Necessity is the mother of invention, so perhaps it is nature's way of
suggesting you upgrade your machine to an IDE drive or SD card interface?

Note that Atari forgot to connect the Chroma pin until very late models.
Nobody noticed because nobody used it - S-video wasn't around then.

The pin is simple to wire up if you are confident opening your machine.

Personally I'd forget trying to drive a DVI/VGA monitor, and just buy a
cheap LCD TV with a SCART or S-video socket. These will use the right
signals for the Atari, and as a bonus you can always use it to watch TV.

Hi Rick,

I'm afraid the 65816 is not pin compatible with the 6502. You'll need
to build an adaptor.

Here's a page describing one:
6502.org/mini-projects/816conv/conv.html

There was a lot of talk about it a couple of years ago on
comp.sys.apple2 but I'm not sure if anybody actually built one.

This may not work all the time but it is worth a shot.
If the RAM isn't shorted and getting hot you can piggy back the new RAM
on top of the old.
Squeeze the pins to gather on the new RAM chip to form a snug fit and
with the computer off slide it over the suspected RAM making sure the
pins are aligned correctly.
Discharge your self before trying this, A static discharge can destroy
the new RAM!
I successfully diagnosed and repaired a TRS 80 video RAM problem using
this method.

Doesn't really work. If I'm not root when compiling (and I don't want to
be root just to compiler something) I get::

Fatal error: Cannot open output file
`/usr/local/nmos6502-oo2c/minilib/c64/Terminal.o': Permission denied

If I'm root then the compiler complains there is no `./Terminal.o`.

Ciao,
Marc 'BlackJack' Rintsch

Thanks for the reference, I bookmarked it!

It's been 20 years since I last looked at an Atari 800 schematic, mostly just hacked on the XL series. I seem to recall that the Atari Technical Reference had the schematics for the REV A OS board. The board differed from all later Atari 8 bits in that it used the 6502B with external rather then internal circuitry to get the 6502B to work with a !HALT signal.

The !HALT signal was added because the 6502 design did not lend itself to multiprocessor designs. ANTIC being a video co processor that needed to take over the buss.

As much as I can remember, I think they may have employed a 74LS245 in a similar fashion to isolate the 6502B from the buss. If that is the case it should make it a bit easier for me to tie in the phase 2 clock. If I get really lucky, there may be enough left over logic on the board I can use to get it functional.

Rick

I'll have to check the memory if all else fails I suppose.. It's much
safer for my XL if I don't start wielding a soldering iron next to it
just yet though! ;)
Anyone know where I can get one of those plastic strips for the keyboard
or do I need to buy the whole thing again?

Hmm - it is that cold dry-air time of the year when static discharges are
big enough to be felt by humans, not a good time to prod those fingers all
over silicon chips.

Replacing the electrolytics in the PSU is far less hazardous.

As you said yourself, the problem diminishes with a different PSU, so you
don't have to be Sherlock Holmes to deduce that suspicion lies more with the
PSU than the 800.

> Anyone know where I can get one of those plastic strips for the keyboard

If you noticed I am not using makefile yet.
That is why there are script build.sh to build and install the
compiler

> Fatal error: Cannot open output file
> `/usr/local/nmos6502-oo2c/minilib/c64/Terminal.o': Permission denied

Yes, if you want to use it as a user then you must change PREFIX
variable in the build script
> If I'm root then the compiler complains there is no `./Terminal.o`.

That is fine :)
I think it is a bug of cc65. option "-o" doesn't save Terminal.o in
the obj/$TARGET directory but instead in the directory where source
located.
That is why script moves Terminal.o and __oo2c.o files to the right
destination and then runs cc65 again.

This is the crucial point and you are exactly right. And any
transmitter working with the +/- 5..15V standard will have no
problem with it. A transmitter shouldn't make any assumptions on
how the receiver is implemented.

That's how all RS232 interfaces (should) work. Either use a
14C88 + 14C89 combination or a MAX232. The 14C89 is a perfectly fine
RS232 _receiver_ and the 14C88 a perfectly fine _transmitter_.

> rather then schematics. When I did a 4049 version people complained they
> couldn't find the chip. The MAX232 was even tougher to find and cost $6
> back then.

You name it. Back then. Nowadays you can get a MAX232 clone like the
ST232 for approx. 1$. Even if we add the 4 caps we are still only
at ~$2 - which isn't that much considering total interface costs.

[as a side note: I know that you have to get +5V from somewhere for
1050-2-PC style interface, that's another issue]

I really don't say your interface can't work at all, hey I built one
myself and also use it quite frequently. It's just that I don't
recommend it because of it's compatibility issues (which I experienced
by myself - as I said it didn't work with any of my RS232 addon cards).

so long,

Hias

360. Resurrecting M.U.L.E. -- input needed

Newsgroup: comp.sys.atari.8bit

I'm leading a project to create a modern, open-source M.U.L.E. clone
that will adhere as closely as possible to the spirit and gameplay of
the original.

The most topic-specific place to discuss this would be at the World of
MULE "Future of M.U.L.E." forum:
<http://www.worldofmule.net/tiki-view_forum.php?forumId=2>

Unfortunately most of the membership there has gone snoozing. I know
there are more M.U.L.E. fans than the activity there would indicate.
So, if you remember (or still play!) this game, and want to contribute
ideas and discussion to the new version that's coming, please sign up
and participate in the forum.

Alternatively, if you happy to be a greybeard who wouldn't touch a forum
with a ten-foot pole, I can sympathize. :) I'll be happy to
participate in discussions here on Usenet, too. But most of my
announcements and new thread-starters will probably happen over at the
forum; it's just not practical to duplicate them all.

Many thanks,
- Joe Strout

I never played MULE, even they I was an avid 8bit fanatic in my day. I
am a programmer though, so if I can find a copy I'll check it out and
see if it is something I could contribute to.

Where can I find old 8 bit games these days?

362. Where to find 8bit software

Newsgroup: comp.sys.atari.8bit

I'm in Australia so stuff rarely comes up on ebay here, and shipping from the states is insane.

Anyone know where I can find 8 bit software? I've just purchased a Prosystem serial doohickey to run stuff from the PC instead of my aging pair of 810s.

Just google for them -- it only took a few minutes for me to track it down last week, but I'm sorry to say I didn't right down the URL where I found it. But I'm sure your google-fu is as strong as mine!

Best,
- Joe

I'm not sure a Prosystem interface will do what you want,
to run programs using the PC as a hard drive.
Are you sure you have a Prosystem cable and not
a APE/SIO2PC cable?
I'm not sure, but the Prosystem cable is for hooking
your 810 to the PC and copying copy protected games
to the PC.....?
A Prosystem cable would be for people who have a
collection of original disks and want to copy to a
*.PRO file for use with a APE cable... no?

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE Game System.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board (B8MB): http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated).
An archive of c.s.a.a posts and the guidelines for posting to c.s.a.a:
http://www.atariarchives.org/csaa/ Moderator: Kevin Savetz

comp.sys.atari.programmer
Programming on the Atari computer.

Found it, now i just have to wait for my cable to arrive to play it on
the elderly beast.
I'm keen to finally play this game, I'm thinking that it would be a
good port for the XBOX360 via arcade.

I was hoping there would be some mega-archives somewhere so you didn't
have to download one game at a time, 100 games would only be around
32MB or so. I do miss the days where you could do something great in
48K or even 8K.

It may be hard to find in some areas so, although it may be a little risky, your best bet is to buy internationally from Ebay, or better yet, some place in the US such as B&C, Best Electronics or Bravo Computers. I think I would try the latter as you SHOULD know that these people *ARE* reputable and so you should NOT have any problems dealing with them!

Again, these places have been in business for quite awhile and so you SHOULD be re-assured that they will NOT do you wrong and so this would probably be the BEST bet for getting what you need without getting your arm and leg ripped off from a bad Ebay deal or you pay through your teeth getting something from there!!! ALL the places mentioned above are VERY reasonable and so it's WORTH checking them out if you need something and DON'T want to be ripped off or have to pay an arm and a leg to get it!!!

I say... RESURRECT it!!!

I haven't looked recently, but there were a few sites that supported MULE and had a PC version of it and a couple were actually pretty good!!! I think I still have them on my old hd.

BUT that game was and *IS* still POPULAR!!! If you want to see how popular it is, try going to www.atariage.com and make a post there and see what kind of response you get from it! I think this is probably the biggest forum, on a website, in the US anyways, that have 8-bit and a mix of other users which probably WOULD be interested in this EXTREMELY popular game and it's a VERY active forum there!

I think it's probably in the Top 10 games of ALL time!!!

If you are using a PC emulator, your BEST bet... then you can get just about ANY game from the following site... www.atari.fandal.cz/games.php

If you DON'T have an emulator, Atari800Win Plus, try this link. This link has been down or changed, but at the moment, it's working!

This would be the BEST bet if you want to check games out and want to get back into the experience of the games WITHOUT paying ALOT to acquire the original games, equipment! However, if you STILL want to acquire the originals, that is HIGHLY understandable! BUT, in the meantime, you can use the emulator to check out games BEFORE you buy them and gives you a QUICK fix until you can get an original! See my post elsewhere in the forum for links to buying original games/equipment.

I like to get an original setup too... when I can. There is NOTHING like playing a game on an ORIGINAL setup!!!

I thought I was alone here, mate;-)

The SIO 2 PC is great stuff, makes life a whole lot easier. I built two
and put one inside my spare 800XL and the other hooked externally to my
130XE. I haven't used my 1050's in a while now.

Hey I'm only a 12hr drive from you ;^)

I'm running a 1980 built 800, you can't kill it with a stick, I have an
800XL for the few programs that require it and my old 400 is missing a
lot of keys so is in a box in the shed.

I'm hanging out to have all my proggies easily accessible.

Jeez, just around the corner. So now there are 2 users in Aussie. Mine doesn't get a lot of use these days unfortunately. I have a 256K 800XL, 64k 800XL, 128k 130XE, 64k XEGS and a 64k 600XL. I have a pair of 1050's and a 850 interface plus a couple of tape drives. Also a Lynx, Jaguar, 2 Falcon030's (one with a CT2), TT030, MegaSTE, 1040STE, 520STM and about half a dozen STFM's. Hell, Atari is some serious business;-)

Makes the PC soooo much more useful. Being able to run progs directly from a directory is pretty cool.

Mark

375. Re: How many are left?

Well, as you said, you are in Australia and so you may be more limited in finding the stuff there?

US/Canada - especially US, would give you MUCH more options! How about making a trip here sometime? LOL

Well, good luck in finding stuff there... I hope you can find some people who do have stuff in their attics/garage, etc!

Maybe you should try posting a local ad once or twice? Or ads in stores, if you are allowed to do that? Never know who might read it and you might find someone who has stuff!

You got the right doohickey. I'd call it and APE/PRO
interface you got there.

>>I'm not sure a Prosystem interface will do what you want,

WRONG. You got the right doohickey.

That's the same one I have. It works as an APE/SIO2PC
cable and as a PRO cable. I've never used its' PRO
features, maybe once or twice.
I'm sure you'll find plenty of stuff to use with it.

Thanks, will have a look. Just got another XL from e-bay so hopefully I
can swap some bits off that if necessary. Got one of the tape drives
working, but the others appear dead or dying.

So my total collection is now...

1 x 65XE
2 x 800XL
1 x 800

1 psu for the XE and XL and one dying

3 x 1050 drives - One which likes wiping some sort of gunk over every
disk I put into it, one that works, but refuses to format everything and
one that seems to be fine.

One, maybe two working supplies for these

2 x 410 tape drives one dead, one half working
Fortunately I can get away with cheap adapters for these
1 x XC12 working
1 x unbranded tape drive, half working, built in power supply

The 800 and XL seem to have a bit of difficulty reading tapes, there's a lot more background noise coming through the TV speaker whenever they load something which isn't there on the XE so god knows what that is (obviously they're so old their hearing is going! ;))

Everything's starting to look a bit fragile..

Both the RF and monitor outputs have no color in the signal. Any
ideas what could cause this? What chip does the video signal originate
from?

There is a pot on the pcb of the XEGS, which I believe you can access with a small flatblade or plastic adjustment tool that adjusts the color. Could be the pot is bad also. I would start there. You can put a meter on the pot and check to see the value changes when turned.

Hi guys-

First off, let me say that this is interesting, and I also am acutely aware that both of you know loads more about RS-232 than I will ever know (or care to know. :)

But perhaps my experiences might be of some value. I tied to build my first MAX-232 SIO2PC interface from Nick's schematics and failed miserably. It was as Rick said a "first project." I ended up buying one from Nick, and as soon as I saw the actual assembled part, I knew that I could easily duplicate it. I used the interface some, but didn't particularly care for the SIO2PC software (sorry, Nick). Then a surge took out the (Harris 232 (IIRC) IC. I did have a good surge protector. Nothing else damaged -- just the 232. Since I wasn't real thrilled with the actual operation of SIO2PC anyway, I boxed it up. Several years later, I read about an improved version of software called "APE" and I also read about a new 1489 interface.

So I downloaded the APE trial version, and went to my local Radio Shack to get a 1489. No problem building the interface, but by now, there would have been no problem with a 232 interface, either. Downloaded the trial APE software, and whoa -- it didn't work. It was built correctly, but just wouldn't work properly. Through trial and error and some valuable assistance from Rick, I found it would work if nothing else was connected on the SIO chain. Then someone suggested that I might have better luck with a 14C89. I got some true 14C89's and they worked perfectly. I tried some 14C89 substitutes. Some worked perfectly, and some didn't. Subsequent to that I built several more interfaces, including 232's. I've lost another 232 interface to a surge, but have never lost a 14C89. Now, for simplicity, I use Steve's dual interface.

My conclusions are 1) a 232 *always* works, 2) a (true) 14C89 *always* works. 3) a 14C89 substitute may or may not work. I've used these with on-board serial ports and also good add-on serial cards, and have found no differences.

I should add a fourth conclusion: 4) APE is great; APE for Windows is *awesome* and keeps on getting better!

FWIW...

-Larry

There is a Jag on ebay australia atm. A toilet seat eh;-). If you ever
want to sell it..... BTW the TT030 and Falcon are great fun. Got a
TTM195 ECL monitor for my TT. Huge screen. Must plug that in again.

393. Disk transfer

Newsgroup: comp.sys.atari.8bit
Date: 2007-02-28 23:09:24 UTC
From: fcohen@pushtotest.com
Message-ID: <1172704164.565642.311240@v33g2000cwv.googlegroups.com>
Source record: 4976

Hi Atari-istas!

Michael Current recommended I post to comp.sys.atari.8bit. Some of you may know my early work on 8-bit Atari systems. I wrote Clowns and Balloons for DataSoft, Cohen's Towers for DataMost, and a bunch of others. The source code to these games is sitting in a large box in my garage. The code is yearning to be released to the public domain. The problem is I do not have a way to transfer the files from the original 5 1/4" floppy disks. I am searching for someone to transfer the files. I will then make all of the files available to the public.

If this interests you then please contact me at fcohen@pushtotest.com or by calling me at 408 374 7426.

Thanks!

-Frank Cohen

Great news, I'll help if none of your fellow country men can!

Or you could buy the cable I did for $30 if you wanted to have a go yourself.

395. Welcome to comp.sys.atari.8bit!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

Why not send it to him for free? Seeing as he is giving something to
the community himself?

398. Atari800WinPlus Keyboard Issues

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-01 15:33:31 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <W92dnZ-P-43eb3vYnZ2dnUVZ_vmqnZ2d@adelphia.com>
Source record: 4981

Has anyone out there successfully used programs like Action! under Atari800WinPlus?

Specifically, it doesn't seem that the emulator recognizes Shift-Ctrl-key commands used by this program, and probably many others.

-Jason

As a follow-up, I immediately received 4 offers to do the transfer. I am going to send a few source disks out to see how successful they are. (These are 20 year old floppies after all.) I'll post what I get back here.

Also, thank you to everyone for your kind and appreciative words. I love the games and am so glad the community formed to support them.

Frank,

Thanks for offering to do this. It would be nice if more of the creators of vintage software would be willing to do this.

I have the equipment to do this - to convert physical disks into ATR disk images that can be used by emulators and distributed online. Do you have any idea of the number of disks that need to be converted?

Thanks.

Jason Harmon

I would have been happy to loan him the required items, but I got
the impression he just wanted the disks transferred, so thats what
I offered to do. ;)

Its also pretty common for someone to have a lot of disks to
transfer, but the hardware was left behind long ago.

GTIA and Antic are the two graphics chips.
Antic controls GTIA, so I'd guess GTIA is the
low level color controller.
I had a GTIA that wouldn't detect collisions

Hopefully there will be no big issues in transferring the disks, but
if there are -- *generally* an XF551 will read disks better than other
Atari drives due to better electronics/data separation. So if some
disks have "unreadable" sectors, don't necessarily throw in the towel.

That works both ways, Larry. I have disks my 551 won't read, the 1050 does
and vice versa. Also have a DTI duplicator in one, that reads others.
Luckily I have 6 drives (Indus probably read some too, that others don't) to
try out

Hi Vidar-
Yes, it certainly helps to be able have multiple drives (and sometimes
even set at slightly different speeds) to read disks that were not
written perfectly. I've run across a few old disks that caused me to
go through my whole "stable!"

412. 800XL memory problem

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-05 18:23:50 UTC
From: Vit Herman <V.Herman@sh.cvut.cz>
Message-ID: <eshn75$2vt1$1@news.vol.cz>
Source record: 4995

Hi

I know this topic has been discussed in the "Dying 800XL" thread as
well, but that thread was rather long and my question is of a bit
different kind, so I decided to start another thread.

The problem is: few days ago, I got one 800XL (for a bottle of wine ;)
and it seems ok except for the fact, that right upon power-up, it goes
to memory test, which shows almost all squares red, so I guess my
problem is with the memory. So I've opened the machine, to check whether
some of the chips is getting hot - none of them does. So I guess I'll
have to replace all of them.

My question therefore is: The memory chips in my 800XL are labeled MT
4264-15 - which spare should I use? I'm able to get some 4164 for a
bargain price - will they do? Any suggestions on other suitable chips?
Another question - is their timing (I guess the -15 means 150ns)
critical or is it possible to replace them with chips with another timing?

I guess I'll leave the soldering to somebody more skilled, but anyway -
is soldering in some sockets and putting the new chips into sockets a
good or bad idea?

Is there anything other I should check prior to replacing the ram chips?

Many thanks for your answers.

Vit Herman

I'll say it once and i'll say it again, those MT ram chips are crap.

If it goes straight to memory test and shows red, i'm sure the problem is in your RAM.

You can use 4164 DRAMS no problem, 150NS is fine, I think 80-150NS will do you fine.

Be aware some DRAMS have a slow bleed effect, meaning if you turn your Atari off and right back on, it might not come up correctly because the RAM has not had enough time to bleed down to 0. Just be aware of this when you try the bargain RAM out.

I would say if they aren't socketed to go ahead and replace them with sockets and try the RAM, that way if they don't work how you want then you can just buy the correct replacements and do a simple swap.

I'd be happy to do this for you, I just repaired Jason Harmon's 130XE and it's on its way back to him now. He had MT type RAM and I removed, socketed, and replaced the RAM.. Works like a champ.

E-Mail me.

Thomas

How does the OS do the self test if there's
no good RAM? If the original poster said that
all RAM blocks in the self test are red, I'd suspect
some other source of the problem.

I said "almost all", not all :) However, any other ideas what may cause
this problem? I would be glad to hear them, because I would like to
avoid any soldering if possible.

Thanks for your answer

Hi

I tried to reply in mail, but it has bounced back off, so I send it here:

I greatly appreciate your offer, however - where are you from? I'm from
Czech Republic, so postage fees might be nasty when sending this for
example overseas.

Anyway, if we would be going to do such a deal - will sending the
mainboard alone be ok? Whole computer is quite heavy so postage will be
higher. If so, should I buy those chips and send them to you, or will
you get them and I'll pay them for you?

Thanks for your answer
Vit Herman

Just the motherboard would be fine, in fact preferred.

If it isn't the RAM (which i'm sure it is), I can still fix the problem.

I agree that if the RAM were 100% failed in each chip there would be no self-test screen or anything. However, it sounds like several banks must be at least intermittently working. The clues that I am looking at are:

1) They are MT type RAM chips - these are KNOWN for failure
2) The RAM test DOES indicate bad RAM.
3) Obviously the main IC's are functioning - OS, CPU, GTIA, MMU, ETC. or he wouldn't get the self test.
4) They are not socketed which means they are OEM.

I have a general method of repairing, which is
replace chips with known good ones, which you can't do probably no second
800XL.
I don't deny docrotcod's idea that one or more RAM may be bad. But......
I'm thinking the
BASIC ROM. The OS is trying to boot and it goes to the self test, as if you
held down OPTION to start. If the BASIC ROM is socketed, that would be a
good one to try with a good one, I think. You really don't want to be
de-soldering a bunch of things if you can avoid it. Uhm... Here's an
idea.... Get a cartridge, any cartridge, and see if that will boot properly.
I think that would bypass the BASIC ROM.

Hi

I have a cartridge (Turbo 2000 loader) but pluging it in changes
nothing. However this doesn't prove anything as I'm not sure about way
to "activate" the cartridge at boot time, because I have no docs for it.

In fact, I have another working 800XL, but I'm not going to cripple it
to repair another one - no win, just lots of work. I saw some guy's page
on the net, where he described the same problem I have and changing the
RAM solved it for him. In fact, I'm pretty much sure his memory test
showed errors in the same places as mine does, but I can't check this
because I don't have my Atari here.

Normally there is nothing to 'activate' on a cartridge. You just plug it in
and turn the Atari on. I live in Oklahoma, US. I'd be happy to fix this
for you if you like. Even if it isn't the RAM, i'll be able to further
diagnose it and fix it for you.

People can vouch for me on here if you need personal references.

Thomas

P.S. I'm just trying to help you fix your Atari, I hate seeing dead Atari's.
It's kind of like my mission ;)

I think that the cart you have is good enough to test my theory. It sounds like a DOS cartridge. Hmm.
A DOS cartridge may try to load BASIC if OPTION isn't pressed. How about holding OPTION and boot the cartridge. If it is a DOS cart, it might come up with a menu if OPTION is held down at boot time. Jindroush Kubec, from the Czech Republic, but no longer accepts and communication about Atari. There are some very knowledgable people in Germany at the ABBUC group. Some read here in csa8. You might be better seeing if someone from ABBUC could help.
It is www.abbuc.de they have enthusiasts from all over the world and may be able to put you in touch with someone local to you.

Turbo 2000 loader is a tape drive loader for
fast tape loading. I think it would not necessarily
disable the built in BASIC ROM. Maybe try
holding START with the cart in and turning on.
It might give a beep sound. The cart is for
Czech tape drives, modified for use with the Atari.
I still recommend ABBUC. Andreas Magenheimer is a member there.

Not in my case, as I said I already tested it.

Ok I didn't know in your prior post if you meant you had adjusted it or
ohmed it out. I had an XE with no color once and one of the resistors in
the video circuit was blocking the color from reaching the monitor. You
might check the resistors in the color circuit and see if they are in spec.

> diagnose it and fix it for you.

I understand, but sending it overseas and back would cost more than
buying another working Atari here. However, one of my friends kindly
agreed to do the ram exchange for me, so I will let him do it. There's
also chance he will keep the Atari once it is working, because we both
collect those old machines, and he has one Didaktik Gama to spare and I
have two Atari - so we may do some kind of an exchange.

> It's kind of like my mission ;)

I understand, it's just that shiping overseas is so expensive. However,
if my friend will be unable to fix it, I would consider sending it to you :)

Thanks a lot for your help.

I know what Turbo 2000 is :)) As I said, my friend will try to fix it,
he has done such things before and has all the necesary equipment, so I
he'll be able to do it. If he fails, I'll look for somebody else :)

Anyway, thanks for all the information.

Not necessarely true that the RAM is bad. I also had a broken 800XL and
the RAM decoder was bad, not the RAM. That's additional logic that
decodes the addresses from the CPU and drives the RAM.

> My question therefore is: The memory chips in my 800XL are labeled MT
> 4264-15 - which spare should I use? I'm able to get some 4164 for a
> bargain price - will they do? Any suggestions on other suitable chips?

As long as the memory organization is the same, IIRC 64Kx1Bit, and the
pinout is identical (likely) and they are 150ns or faster, then this
shouldn`t be a problem.

> Another question - is their timing (I guess the -15 means 150ns)
> critical or is it possible to replace them with chips with another timing?

It's possible to replace them with faster chips.

> I guess I'll leave the soldering to somebody more skilled, but anyway -
> is soldering in some sockets and putting the new chips into sockets a
> good or bad idea?

Sockets are a good idea, you cannot burn the chips when replacing them.
Just don't try to de-solder the old chips. Use a wire-cutter to cut all
pins off, then solder the pins out. Otherwise, you likely damage the board.

> Is there anything other I should check prior to replacing the ram chips?

Is there anything else socketed? The CPU could be bad (address lines,
power), ANTIC could be bad (DMA logic faulty). Yes, I know, it sounds
that then the computer shouldn't power on, but that's not so easy,
depending on what exactly is broken.

Could be even a faulty basic ROM that doesn't disable itself on the bus
and thus confuses the timing only for RAM. On my bad 800XL, I had the
symtom that the RAM test failed often, not always. The Basic ROM was bad
(really!), and the RAM decoder was bad. The RAM was fine.

So long,
Thomas

I hope that's not the case because I don't know where to get spare one :)

> As long as the memory organization is the same, IIRC 64Kx1Bit, and the

The guy who offers them says he doesn't know their timing but says they
should be OK for 8bit computers. I will check the details today. But he
offers them for 2 CZK each (aprox. 10 cents each) so if they won;t work,
no damage done - at least no economical damage :)

> Sockets are a good idea, you cannot burn the chips when replacing them.
> Just don't try to de-solder the old chips. Use a wire-cutter to cut all

I can't check - however the machine goes to memory test right upon
power-up and it the memory test fails - always (I had tried at least 10
times).

Thanks for information and advice

While I agree with what everyone says, I think we're thinking it to death.
Sockets are not a bad idea. Start simple and swap the RAM.

Vit,

Thomas (docrotcod) just replaced bad RAM in my 130XE... it had almost identical symptoms to your 800XL. The sockets are nice in that if a RAM chip ever goes bad again, its a very easy fix. From the time I sent him my 130XE, I had it back working in 9 days. Being overseas, I know shipping is an issue, but Thomas did first class work very quickly.

I always had a problem telling if a resistor or
capacitor was open or shorted. If you put the
VOM accross the resistor, it will go backwards
thru the system. You don't want to go clipping
resistors to check them..?

438. Letter/Data Perfect

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-07 00:54:30 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <dImdnbN7zqihkHPYnZ2dnUVZ_q6vnZ2d@adelphia.com>
Source record: 4921

Does anyone out there have a disk image of them 80 column versions of LJK Data Perfect and/or Letter Perfect? These were versions designed to work with the Bit-3 80 column board for the 800.

If you do, please ping me.

Thanks.

Jason Harmon

Atari BBS List 03/07/2007

http://www.atariplanet.info/ATARIBBS.TXT

Maintained by Trevor Holyoak <trevor@holyoak.com> and Greg Goodwin
<Greg.Goodwin@familynet-international.net>

(Greg single-handedly called and verified that all the dial-up BBSs in
the United States and Canada are
now either down or wrong numbers. He also came up with the new list of
systems accessible on the Internet
that are dedicated to the Atari 8-bit. Thanks for all the work, Greg!)

```
*******************************
* Atari 8bit Support Systems *
* and Chat *
* available via the Internet *
* as of 03-07-2007 *
* *
*******************************
```

```
-------------------------------------
8 Systems Listed
-------------------------------------
```

01 The Boot Factory
WEB: http://bf.amfband.com
A8bit BBS: telnet://bfbbs.no-ip.com
or: telnet://bfbbs.dtdns.net

02 Inside The 8-bit - (2 lines)
telnet://TCPIPExpress.dyndns.org:8888
:8889
expresspro.dyndns.org:8888

03 MouseNet BBS
telnet://atari-bbs.kicks-ass.net

04 Dark Force BBS (Run on a Mega 2 ST)
telnet://darkforce-bbs.dyndns.org

05 ST Guild BBS
stguild-bbs.dyndns.org

06 Closer to Home BBS
cth.dtdns.net

07 telnet://irc.atarichat.net
(Enter "atari" at login, skip the password (enter), and then enter a
name..
will take you straight to the IRC chat.)
Someone is there most of the time.

08 telnet://www.atarinews.org
(Enter in this order... "bbs", "Bbs", enter name and password at the
next
login, enter, t for talk, c for chat, then a name and you're in)
Chat times 7:00 PM CST Tuesday nights
10:00 am CST Sunday (EuroChat)

```
*****************************
* Atari 8bit Support BBSs *
* (dial-up list) *
* *
*****************************
```

(The following list is of boards that are located in the Eastern
Hemisphere
and have not been verified in many years. It is included for the
benefit of
those that live there in case they are still operational.)

Please keep me informed with updates to the list and I'll post
revisions
as necessary. In particular, if one of the BBS's is within your local
calling area, please give them a call and let me know whether they're
currently operational.

All boards are assumed to be operational 24 hours a day, 7 days
a week unless otherwise noted.

The format of the individual entries is below.
Note that each entry uses at least five lines (all of which are
less than 40-columns in order to make this easily 8bit readable):
"Type" indicates the type of hardware used to run the board.
"Status" is whether the board was up or not the last time it was
checked.
"Status Date" tells you when the entry was last updated.
--
There can be one or more lines of "Notes".

An asterisk (*) next to the board's phone number indicates that entry
has been updated since the last version of this list.

<BBS name> : <phone number> [*]

I'd like to thank him as well - I try to maintain a similiar list on
DarkForce, and a random logoff screen that lists other (still) working
BBss that user may be interested in contacting.

Oh for the record, DarkForce is run on a Mega ST2, upgraded to 4 megs, and
with a 16 mhz Adspeed accelerator, 4 gig HD, and a CDRW...and all Atari ST
software - no emulation. :)

There's lots of ways to copy protected commercial
A8 disks. The most challenging, to use a disassembler and modify the
protection code on the disk. The simplest, as you ask, download the already
protection removed disk images someplace, like Holmes disks.
But I would recommend the PRO system from www.atarimax.com it will make a
bootable image you can use with an APE/PRO interface. I haven't used it,
but I think it would give you 100% compatible results, and would probably
be legal, as you are making a backup of software you own.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated).
An archive of c.s.a.a posts and the guidelines for posting to c.s.a.a:
http://www.atariarchives.org/csaa/ Moderator: Kevin Savetz

comp.sys.atari.programmer
Programming on the Atari computer.

I had always used the Happy enhanced 1050 and its software for this. I was able to copy most protected disks at the time.

There was also a software-only package I used 20-something years ago, called Chipmunk I believe, that had patches for many protected packages and created non-protected disks from them.

449. Atari Reference Books on eBay

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-10 04:08:19 UTC
From: Greg Andrzejewski <pressyourluck85@yahoo.com>
Message-ID: <C9edne824LGysm_YnZ2dnUVZ_riknZ2d@comcast.com>
Source record: 4932

I've listed some Atari Computer reference books on eBay. All starting bids
at or below $.99 no reserve, just trying to get the books in the hands of
someone who can use them. Will combine items to save on shipping.

COMPUTE!'s First, Second, and Third Book of Atari
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091954110
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091954974
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091956382

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091957772
COMPUTE!'s First Book of Atari Graphics

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091959944
Atari BASIC, A Self-Teaching Guide

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091961141
Your Atari Computer- a guide to 400/800 personal computers

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091964296
Atari Sound and Graphics- A Self-Teaching Guide

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091966262
Atari 400/800 Technical Reference Notes C016555. Not sure what to make of
these. It's about 500 pages of what look to be ROM listings, schematics, and
pinouts. Some pages marked "Reproduction Prohibited without Publication
Dept. Approval." PM me if you want more info/pics. I'd imagine this would be
pretty useful to someone on these boards, if the info isn't easily available
online.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280091966841
Atari BASIC Reference Manual with 400 or

451. Any way to put lots of Atari 800 software on a single "cart"?

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-10 16:52:01 UTC
From: OhioGuy <none@none.net>
Message-ID: <esunninlb1@aioe.org>
Source record: 4934

I was remembering the days when I got to play around with my cousin's Atari 800 XL computer for a week or two. It had loads and loads of classic games on cartridges and disks. It was a lot of fun to mess with.

Here's my question. Now that backup ROM images are easily available on the net, has anyone ever made something like a cartridge that you can load gobs of ROM images to some sort of cartridge based reader?

I don't know exactly what it would be - same size as a cartridge, but you can insert an SD card into it, or something like that, and use it for storage?

452. Re: Any way to put lots of Atari 800 software on a single "cart"?

Hi,

U can check with www.atarimax.com and also www.mr-atari.com for cartridge
SDcard readers.

Yes, I suspect the original poster is talking about
commercial software published and copyrighted
in the US. US copyright law allows making a backup of copyrighted 'media'
you own.
Even tho the publishers didn't want it copied
successfully, it is legal to make a copy.
This made/makes sense as almost all media,
tapes, floppy disks, CDs, DVDs are subject
to accidental or time related failure.
Today, most software is 'licensed' in order to
get around the copyright backup provision I guess.
Even though, I believe, US copyright law permits
making a backup of music/software, the new
Digital Millenium Copyright act makes it illegal
to even discuss ways to circumvent copy protection.
I'm sure the DRM features of Windows, OS X
are designed to limit and/or prohibit making
backups, say, to be able to play the same tune
on more than one iPod/ZUNE/MP3.
The publishers and Microsoft in particular are
more and more limiting what someone can do
with the device they purchase, ie. it is the publishers
who own the computer/music player you use,
and they have control over what you can do, when
you can do it, where you can do it, ie. they own
your device. Similar to the property taxes on
real estate, in the time it takes to pay off a loan
on real estate, you've paid the cost of the property
in real estate taxes, so it is the municipality that
actually owns the property, and you just rent it.

Greg has informed me that after sending me the current changes he was
told that the remaining dial-ups left on the list are also no longer
functional. It's kind of sad to think that there are no dial-up
systems left anywhere in the world.

That is a bummer. When I resurrected my BBS, I thought about doing
dial-up, but the advantages of Telnet were just too many. I still do miss
that warbling sound, and the ability (on DarkForce at least) of playing
music through your modems speaker (if it was so equipped). :)

460. Auction: Former Atari Employee Items

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-11 07:01:41 UTC
From: Tom Tom <sometomtom@tomtom.com>
Message-ID: <pPNIh.296$Bi2.79@trnddc01>
Source record: 4943
Cross-posted to: alt.atari-jaguar.discussion,comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari

I've posted onto Jaguar Sector II (http://jaysmith2000.ipbhost.com/) and
Atari Age (http://www.atariage.com/) info about auctions being conducted by
B&C (www.myatari.com) on behalf of John Skruch.

Here's a link to the Atari Age site posting about the auctions where you can
find links for more info.
http://www.atariage.com/forums/index.php?showtopic=103426

Enjoy.

461. FS eBay: Atari 8-bit SCART / RCA Phono Cables

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-11 10:08:48 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1173607729.8226.0@proxy02.news.clara.net>
Source record: 4944

Hello All,

I have new batches of Atari 800/XL/XE to SCART or RCA cables. These are currently being sold on eBay at a fixed price. Link is:

UK/Europe: http://search.ebay.co.uk/_W0QQsassZdeangarraghty

US/Canada: http://search.ebay.com/_W0QQsassZdeangarraghty

Sorry I'm having to promote these on here, but eBay's crazy decision to stop listing UK auctions on eBay.com has meant that nobody outside of the UK ever gets to see the listings.

Dean Garraghty

That is bad news. I've gotten hard to find stuff
from the UK, only last month. I have a search
for certain items, and the UK was included in
my search results. I'm sure it was a www.ebay.uk or something like that.

They are no longer including UK listings as standard unless the user
selects Worldwide from the search options. This isn't done by default
and nobody would generally bother or know anything about it.

Here's a link to eBay's blurb about it:
http://www2.ebay.com/aw/uk/200702.shtml#2007-02-16181558

478. Whither game megadisks?

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-16 01:12:03 UTC
From: Chris <cchiesa1@rochester.rr.com>
Message-ID: <1174007523.604944.176360@l77g2000hsb.googlegroups.com>
Source record: 4862

Hi all...

A couple of years ago I found-and-downloaded twenty or so "megadisk" images, named Games001.atr, Games002.atr, ... etc. Since then, my copy of Games003.atr seems to have gotten corrupted, and Games004.atr and Games007.atr have gone missing entirely. Worse, a Google search fails to find a source for these images anywhere on the Web.

Anybody got 'em and could send 'em? Please e-mail me even if you also post here, as my news feed is remarkably unreliable, as also is my ability to contact Google Groups at the present time.

Thanks in advance,

Chris Chiesa

Phones are old tech. It really is easier for me to call BBS's on my Atari 800 with ETHERNET than phone. :) Strange eh?

Well, anyway, I haven't given up hope that as I try to nail down a good BBS list of ALL United States BBS's that I will find an Atari BBS still off the network.

I look forward to bring them back into the Atari fold. :D

Oh the modem music. How did that work again? I haven't heard of that feature on any other BBS. Would it play through the speakers of a conventional hayes modem?

I had a small program, activated by the caller from the main menu, that
would play small music files by using the callers modem's speaker. The
modem did have to have a speaker to work though. I believe I had something
like 8 or 10 songs setup. I don't have that menu option listed anymore
(doesn't work with telnet), but I've still got the software itself.

There are three such compilations I'm aware of.
I think you got the mega image from the CTH
archive .atrs. Then there's the Yogi compilation
mega images. And then there's the Holmes
mega images, some for the ST DI images,
and I think Holmes also has the Yogi images.
The Holme's archive is on the net. CTH arcive
used to be at ftp.spudster.org, but I think it is gone.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS

Look at that, "Transylvania" for the Atari ST. I was not aware that
game title was released for the ST. According to Wikipedia there
were three games in the Transylvania series.

I still like adventure games with text input/output and static
graphics images.

I recall back in 1983 / 84 an Atari store in San Diego that used to
sell software for the Atari from an outfit called Brown Bag software.
The software was on tape or disk with a simple printed instructions in
a stapled brown lunch bag. Was this something locally or did others
ever recall seeing this?

Your best chance of getting 3" disks is here in the UK. A few long-forgotton Amstrad machines used them (the Spectrum +3, Amstrad CPC 664, Amstrad CPC 6128, Amstrad PCW 9512). A quick search on eBay (UK) shows quite a few games for these old things going on 3" disks for as little as $1. Try item numbers 330082337935, or 120096665304 for 10 blanks for about $15.

Very interesting.

I've heard from several people since I first posted; thank you all! Helge, you are correct, the disks you describe are the first two in the series I am talking about. Russg, I'm not sure WHERE I originally got 'em.

Steven Tucker, "Charlie," Stephen Shepard, and Vidar Olavesen all e-mailed me copies of the specific disks (by number) I originally mentioned. I haven't looked at anything but Games003.atr, thus far -- but guess what? EVERYBODY's copy of Games003.atr appears to be corrupted just like the one I started with! Apparently the original megadisk image file we all downloaded from a common source 'way back when, was already corrupt when we obtained it! :-(

But don't take MY word for it; maybe something's wrong with my emulator, my DOS image, etc. Try it yourselves-- PLEASE! I am running Atari800Win PLus 4.0. I attach a MyDOS 4.53 disk image as drive 1, and Games003.atr as drive 2, then cold-boot the emulated Atari with Basic disabled. At the DOS menu, I (L)oad "D2:MILLIPED.E" -- and instead of the game "Millipede," I am immediately returned to the DOS menu with an "Error 136" message.

Analysis reveals that the third or fourth data sector of the file is corrupted, in such a way that the "next sector" field contains 0000, terminating the file prematurely. (Sectors beyond the bad one appear to be okay and properly "chained," such that ONLY this single sector is bad.)

A full-on analysis of the entire Games003.atr image indicates that MILLIPED.E is _not_ the only corrupted file on this megadisk. :-(

Further bulletins as I refine my analyzer program.

Unfortunately I am going to be moving, so may not have time to get into this in any greater detail for anywhere from a week to several months, if I don't get to it TONIGHT... and it's past midnight NOW. :-P

But I digress. I also heard from "scott" <seymour-shabow@excite.com>, who identifies himself as the creator of these megadisks. Scott, I have been on vacation all week with barely enough Internet connectivity to post here, and NOT enough to e-mail you directly. I would be EXTREMELY interested in hearing whether YOUR ORIGINAL copy of, say, Games003.atr has the problems I see in all copies to date -- and if so, whether you could conceivably re-create and reissue it. I plan to check all the other images in the series, too, as time

permits.

Further bulletins as events warrant, and thanks to all who will
undoubtedly be pricking up their ears and digging deeper into this!

C.

Okay, I was able to pound the last few nails into the lid of my
megadisk-image analyzer (it's a Perl script if anyone cares), and
check _all_ of the Games###.atr images I have.

The good news is that there are only two corrupted images out of the
twenty (Games001.atr through Games020.atr) I have; the grand total is
three corrupted files:

Games003.atr:
MILLIPED.E - sector 951 links to sector 5269
PREXOR. - sector 951 links to sector 5269

(Note that the bad sector is the SAME sector in both files
-- there are subtler problems here than just one bad sector...)

Games008.atr:
ANTEATER. - sector 3550 links to sector 42441

I'll be interested to see if others of you can reproduce these
results, using whatever MyDOS-disk-analysis tools you have. Scott, we
definitely need a rebuild of images 3 and 8! (And if there are disks
beyond #20, I'd love to receive them so I can check them too!)

Chris

495. NEW SERVICE... ATARI BBS GATEWAY!!

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-19 05:47:51 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <001bf102@familynet-international.org>
Source record: 4879

FamilyNet International Newsgate

A long time & stable Dallas BBS has offered to provide a "Favorites page" for the Atari BBs users. Basically I provided a up to date BBS list of the active Atari sites out there, and he created a place you can go to, bring up an Atari telnet menu, and go to an Atari BBS. :)

Ever been curious to see the online world of Atari computers? Come check out the Prison Board BBS:

972-329-0781 (this number good for people want to try out Atari modems, and dialup means.)
216.62.20.217 (This IP number is great for Lantronix users, and has not changed for a considerable time.)

Never has the online Atari world been so easy to access from your Atari computer. Simply call up the above system, get to the main menu, X for the internet menu, and then A for the Atari menu. From there, it is simply a matter of hitting 1 through 9 for the Atari BBS's. Atari BBS's in many cases run on real Atari computers like the one you're calling with.

And the Prison board makes a great E-mail service too. :)

Let me know here if you have any questions, and many thanks to the Prison Board BBS for this awesome service.

Hmmmm I'll check those when I get home from work today - I can see why
I never noticed if they were bad because all 3 are games I never
play. I'll have to rediscover how I made those images but pretty sure
you can just take an image file, "format" it with mydos, and then copy
the files up to it. It's possible also that the sector links are just
bad and can be fixed. Tell you for sure that all the images were
created "fresh" so the sector links SHOULD be sequential. It's been
ten years or so since they were created so memory is a bit hazy on
this.

I think they go to #22 or 23.... I almost never play anything over
mega #9 anyway. The later disks had more of the larger sector count
programs on them and it was getting harder to maximize the space. The
earlier disks have more of the stuff I liked to play hence their
layout.

I didn't think they would catch on the way they did - at the time I
just wanted to set up an old PC with APE/SIO2PC without a hard drive
and with 2 floppies, that's why I picked the size they are, so would
fit on a PC hi density floppy.

I wonder what it sold for. I had one just like that, but sold it
about 10 years ago. I think I got $15 for it :) I've still got one
or two of the floppies somewhere. I should have kept it; It was a
VERY well engineered piece of hardware. Too bad it was little more
than a paperweight.

Hello Everybody,
I found something interesting:
http://homecomputer.pl/tommark/sprzet/202
Does any one see this Atari 520 with strange square keyboard?
Anybody know something and can write about it?
This is my friend's computer and he can't find any information.
Best regards,
Grzegorz

I've seen displays in small computer shops with similar marketing. I've seen everything from paper lunch backs with a sticker describing the contents to close the bags to pre-printed disk mailers with the contents described on one side and a mailing label on the other side (perfect for quick gifts of shareware).

They go to games 022, which is not even full. my copies of 3 and 8 have the same corruptions - odd as I remember testing them extensively when I made them (on a real atari). Anteater I have as a standalone .atr file (which will need conversion back) I'll have to look for the other files, but I can tell you that I got ALL of the files from someone on the internet way back when and merely put them on the mega images.

Email me and I'll send you the 21 and 22 mega disks. I'll have to re-figure out how I made the images in the first place since making a "big disk" in mydos did squat.... I think there was a program that did it would have to delve into it. Hell, I have to even find my registered copy of Ape to try and duplicate anything off my real ataris.... (and my sio2pc cable.....)

I probably have some of the files on disks from way back when but would have to check.

It depends if you count type in games from the magazines.
Does anyone else remember 'Medieval Combat' from creative computing. My
brother and I spent a *month* typing that sucker in and debugging it,
and it used to take around half an hour to load from tape.

But it was worth it!

No binaries in this group and I don't have other newsgroup access any longer other than google anyway. The program I used someone else wrote and is probably in the umich archive.

There's nothing in those disks including the utilties that isn't available in other formats if you search around. There are still tons of sites that host it.

Original message follows.
I don't know if you mean do I send copies of
my CDs for Pay. I don't have my archives on
the internet, but they are pretty much available.
There was another thread that mentions the
Holmes and CTH archives whereabouts.
It's not that I have anything agianst making copies
of my CDs, I'm just too lazy I guess, there seems
to be others who will mail out Holme's archive
for instance. And Tom Hunt charged, well,
$50 for his archives mailed to me, so I guess
there's a little reluctance, even tho Tom probably
wouldn't mail them today, but, ftp.spudster.org
has the CTH archive. I'm pretty sure the spudster
site has updated the CTH archive with new files.
But I ramble.
Regards

there was a company called white bag software. i used to carry their
stuff. i still might have some somewhere stored for posterity. the
games came in a white bag, sometimes the bag was shrink wrapped,
sometimes not. some had hanger hooks on the bags, some not.

> right URL? It is ftp://ftp.spudster.org

Thank you for the reply, it confirms what I suspected, that the problem
is local to me. I ftp routinely to various sites and this is the only
site that this happens on. Could it be they use a certain port I need to
specify? I will double check my router settings to
see if it is somehow getting filtered, other than that it I guess it would be
Verizon dsl doing something funky. Luckily, I was able to locate all
my favorite software(except for a amateur anti c64 demo-not the one
on the abbuc disks) so I am good to go, but wanted to solve the mystery.

Since I'm on linux I usually use ftp to connect to
ftp sites, I'll cut and paste an example:

<deleted>@onyx:~$ ftp mirrors.kernel.org
Connected to mirrors.kernel.org.
220 Welcome to mirrors.kernel.org.
Name (mirrors.kernel.org:bingham): anonymous
331 Please specify the password.
Password:
230- Welcome to the mirror archives of the
230- LINUX KERNEL ARCHIVES
230- mirrors.kernel.org
230-
230-This site contains mirrors of other archives. If you are looking for
230- the Linux Kernel Archives, please go to ftp.kernel.org instead.
230-
<snip>

When I do it for spudster it just hangs:
<deleted>@onyx:~$ ftp ftp.spudster.org

So thats when I tried pinging(I'll do successful example first):

<deleted>@onyx:~$ ping mirrors.kernel.org
PING mirrors.kernel.org (204.152.191.39): 56 data bytes
64 bytes from 204.152.191.39: icmp_seq=0 ttl=49 time=101.824 ms
64 bytes from 204.152.191.39: icmp_seq=1 ttl=49 time=105.023 ms

```
64 bytes from 204.152.191.39: icmp_seq=2 ttl=49 time=102.391 ms
64 bytes from 204.152.191.39: icmp_seq=3 ttl=49 time=103.110 ms
--- mirrors.kernel.org ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 101.824/103.087/105.023/1.207 ms

<deleted>@onyx:~$ ping ftp.spudster.org
PING HOUSE.spudster.org (68.190.83.42): 56 data bytes
--- HOUSE.spudster.org ping statistics ---
12 packets transmitted, 0 packets received, 100% packet loss

<deleted>@onyx:~$ ping spudster.org
PING spudster.org (68.190.83.42): 56 data bytes
--- spudster.org ping statistics ---
9 packets transmitted, 0 packets received, 100% packet loss
```

521. Home-Made Axlon Compatible Memory Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-22 17:36:59 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <7qmdnTmJedsmI5_bnZ2dnUVZ_qCmnZ2d@adelphia.com>
Source record: 4806

I've been looking for some time for an Axlon compatible memory upgrade for my 800. As I haven't found one, I have been looking into a home made solution instead. I have seen plans for a 256K board made from an old 16K 800 board, but have seen it stated that this board is not 100% Axlon compatible unless modified.

Has anyone built one of these boards, and more importantly, have the information on how to make it 100% Axlon compatible?

Any info would be appreciated.

-Jason

524. Updated MyIDE Image Manager and MyIDE Config

Newsgroup: comp.sys.atari.8bit
Date: 2007-03-23 05:53:49 UTC
From: Shawn Jefferson <sjeffersonTAKETHISOUTTOREPLY@shaw.ca>
Message-ID: <0qq6039l7bk9gutlvl4p1dbpeju845fi5h@4ax.com>
Source record: 4809

I just posted the updated versions of these two programs on my website.

http://jeffersonsauctioneering.com/atari/

The MyIDE Image Manager has had some significant changes, at least under the hood. I've moved the image table to the last image slot of the hard drive and taken the descriptions out of the image table so that I only use the Mr. Atari descriptions. This makes the image table smaller, but it does increase the time taken to search or scroll a screen at a time through the image list. Since there is more disk seeking going on, I sped up the screen scrolling considerably in this version.

I'm still undecided whether or not only using the Mr.Atari Image Manager descriptions was a good idea or not. I dislike the speed hit searching and sorting takes, but I suppose it makes things easier overall.

Anyway, let me know what you think. Here's the complete list of what's new:

version 4.0 (02/20/2007):

- moved image table to last image slot on drive (not compatible with myideman 3.3)
- created utility to convert image table from version 3.3 to version 4.0
- removed descriptions from image table, uses only Mr.Atari description
- removed ability to number disks by pressing 1-9 (useless feature)
- faster screen scrolling!
- cosmetic changes in utility menu, removed Sync START description option
- fixed sort function to ignore case
- can minimize screen while sorting, to help speed up sort
- better progress indication in sort screen

PS. I will be releasing the source code soon, on the website, but just want to clean it up a little first and add some comments here and there.

I found this in my mess (literally) of documentation.

AXLON RAMDISK COMPATIBLE MODIFICATION FOR 800+ 256K DAVID BYRD For complete compatibility with any software written for the AXLON system memory expansion, the modifications shown in FIG. 8 must be made to the ROM board.THESE ARE NOT REQUIRED for non-AXLON mode of operation, but if you have SYNFILE, SYNCALC, or any other software that supports the AXLON system (including the AXLONRAMDOS) then these additions areneeded. (the SYN- programs will recognize all 288k!!) Obtain a 74LS00 and a 74LS30 chip. remove the jumper (if you installed it in the regular mod) from Z401pin 7 to pin 20 on the edge card.Mount the new chips "feet up" deadbug style and do the wiring shown in FIG. 8 carefully! Note that A402 and Z401 are already part of the ROM board.Good luck! All Art and this file Supplied by the CHAOS BBS [phone number withheld]

The thing I find funny, is Jay Miner, the guy who invented the AMIGA, is the same Jay Miner that invented the Atari 400/800 line.

Jack Tramiel and his people who was responsible for the C-64 are the same ones who created the Atari ST. If you were a *real* fan of the earlier machine, you should have switched companies, and stayed with the people who designed your beloved machine. What would have been funny, is if Commodore did not sneak in at the 11th hour, and steal Amiga from under Atari's nose, and it would have been the Atari Amiga and the Commodore ST.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

A Commodore ST would probably have used a 16-bit 6502 variant and probably would have helped MOS Tech stay relevant much longer than it did. If Commodore had been capable of keeping it's talent around a Commodore ST would have been an absolutely awesome machine. But, Jack and Irving had a knack of running everyone off until online Irving was left.

I've been well. Things have been as busy as ever, and I'm not doing
Atari-related stuff as often as I used to, but I do still try to get
into it every now and then.

My kids have actually gotten interested in playing Atari games, so
I'll probably be spending more time in this area again for a while.

- Trevor

Hi

What happened to the excelent Clarence Dyson site with the Atari mods?

These URLs no longer work:

http://www.geocities.com/atari
http://www.wolfpup.net/atari/atari.html

There's just the Archive.org backup:

http://web.archive.org/web/20050209151624/http://www.geocities.com/atarimods/

Will this site be back online again?

Regards

Somewhere lost in time a guy added a 256k static RAM to an 800 memory board. I looked for it but couldn't find it. Looked like a really neat hack since I am used to seeing rows of chips and support chips on an 800 RAM board. This just had the static RAM and a support chip or two so it looked kind of lonely. I can't remember how he banked it but I thought he did something tricky like Axlon compatibility and allowed it to be the only memory board in the computer.

I'm sorry but I don't have a server where I can host the files but I will be happy to email them to anyone who requests them. (Check your inbox!)

The .PICs turned out to be Koala pictures, btw. I used Atari800win plus to make screen captures (.PNG). I put them with the other files for convenience.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS

Duke Nukem has just been released for ATARI 800.

It will be sold on 643 floppy disks or on cartridge.

A cassette version will not be released.

Actually I think Duke Nukem would be possible on 1 disk. After all it is
just a simple platform game from 1991.

556. Old topic: Cybiko

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-01 19:31:58 UTC
From: Rick Cortese <ricortes@earthlink.net>
Message-ID: <OMTPh.17275$PL.6108@newsread4.news.pas.earthlink.net>
Source record: 4841

Short story goes long. Trust me, it does wind around eventually.

My family has been pestering me about my old high school in particular. Seems it is now the lowest rated school in the district. Achieved national recognition because of a couple of stories: With the 'No Child Left Behind' rule pretty much any kid that wants to get out can transfer. Of course the only kid who wanted to transfer was a top student so the principal wouldn't let him leave because it would drop the school even farther down academically. The other story was about a student that was here illegally and had a Coca Cola scholarship to Harvard or some such withdrawn.

So my family says ~Seeing as how you are sorta retired/not doing much, why don't you get your teaching credential and see what you can do? Yeah right! I am the least likely candidate for the role of Jesus <pronounced Heysoos> cleansing the temple you have ever seen.

So I sign up for my CBEST. I figure I can just flunk that sucker and any talk of me being a teacher will be squashed like a pancake. Naturally I lose my drivers licence the week before the test so I goes looking for my passport, you need photo ID. Turns out the little woman apparently through away my passport. She throws away everything important and keeps bits of string and feathers. Threw away my income tax returns two years running when I took a break from working on them at my desk. Tossed them in the fireplace and burned them she did, not joking but I wish I was. Isn't creeping senility grand?

w/o photo ID it was a problem taking my CBEST. I explain my problem, that is the state takes 6 weeks to replace your drivers licence and after being shuttled around to the administration building I am told. "We just need any photo of you to allow you to take the test. Even a Cosco card would be OK if you can leave it with us." So I says, "How about if I just go to Walgreen's and buy a Poloroid camera?" and they give me the OK. I get back, they take a snap shot, I fill out some forms, they say I can take the test. I am an hour late for a 3 hour test but I have kind of a cavaleer 'tude so I breeze through it in about an hour.

My drivers licence comes, I fill out more paper work, notory public cosigns the forms, et cetera. Few weeks pass and suprise of suprises I pass the CBEST! Not exactly flying colors, I thought I didn't miss any on the math but only got 66 out of 80! I must of gotten off a row on the answer sheet, but still good enough to pass.

So now it becomes time to send in my credential package. They expect transcripts from every college I attended. They don't have enough room

on the forms for the number of colleges I went to. Just a bachelor's from St. Mary's College but I also did stuff like took a C programming class at West Valley College, a local JC, to the tune of ~200 units in total.

But heck, for me no problemo. I keep transcripts of all my college course work going back to 1968. Only transcripts that weren't in my double secret probation hiding location were my St. Mary's ones. You can see where this is going: Little woman found them and tossed them. Must be some real odd wiring going on in that brain that says "These look important so I must do something important like sacrifice them to the fire gods."

She's starting to feel just a little bit self concious about throwing away and/or burning my important papers so she actually helps me look for the transcripts. Guess what she pulls out? My old Cybiko!

For those of you that aren't familiar with Cybiko, it was a 11 mHz H8 hand held computer. The H8 is cousin to the 68000 series of micros so you pretty much have the processing power of an ST in your hand. There were several serious faults with the thing, like small low rez 160x100 screen in 4 shades of gray, tiny keyboard. What it had going in its favor was built in radio networking for chat, serial port, free C cross development package.

I start trying to revive the thing. I have to pull the NiMH cells and clean up the mess they leaked. I find a charger that is about the right size and voltage and sure enough, the thing leaps to life. Then our story takes another twist. I have what is probably the worlds oldest and fattest weimeriener. He's 15 years old and last time I took him to the vet he weighed just over 112 lbs. Being 15 years old he is kind of hard of hearing and can't see. He plows into the Cybiko/recharger cable and pulls it off the table and onto the ground. He's not quite as quick witted as he used to be so he just keeps plowing forward with me yelling at him to stop until the Cybiko disintegrates. Broke the damn mother board. I was thinking maybe just hot wire it.

I start looking on the web for Cybiko and predictably enough, defunct. Not only that, but there are few and far between fan sites. I do find an archive where I can get some of the Cybiko software but I know I will need the RS232 cable to port anything over. I do my eBay thing and like everything else that has been relegated to the junk heap, there is tons of things Cybiko there.

I get a model like my dog trashed. I buy a 1 meg memory expansion but heck, I don't know if it is for the model I just bought or the latest greatest Cybiko Extreme with 18 mHz processor and USB interface so I had better get one of those too. There is a MP3 player available but only in England so I pass. The good news is the price on this stuff has dropped to less then $10. The bad news is most of the sellers seem to inflate the shipping on a 1/3 lb device the size of a pack of cigarettes to $25.

Anyway I am looking forward to hacking the device. I am thinking since there is software for one Cybiko to be hooked to an IBM to work as a radio network file server there ought to be something I can do with my Atari. I don't think they have enough pins coming out of the RS232 connector to do a SIO2PC interface but I should be able to get one to radio modem type file access on the IBM.

Rick

> Rick
Rick, I don't understand what the Cybiko has to do
with your public school teacher's license.
I understand playing with old hand helds. I just
put a HP41 emulator on my Palm Tungsten E.
And I put new batteries in my HP41C, just to
keep it going. The HP41C probably pre-dates
your Cybiko.
So, you take the test, pass it, now are you ready
to start teaching? Teach what? I substitued in
the Cleveland Public School system (Ohio), but
gave it up. I couldn't manage getting the kids
to behave moderately acceptably, and didn't follow
the regular teacher's class plan.

Does anyone out there have one lying around in a basement, under a bed, or hiding behind clothes in a closet or someplace else? Also, can you please sell it to me for "FAIR" price?

I have seen many go on eBay for the past 3 years and ALL ARE OVERBIDDED ON! I am going to use it for development and designs so I really can't pay $200.00 for a mere 8-Bit Computer Keyboard.

Please let me know if you have one for sale before throwing it up on than DAMN EBAY!

Thanks a lot!

How hard would it be (or is it possible) to convert an 800xl to a 1200
xl?

Bill H

Did you happen to see that movie or are you familiar with
the term "Butterfly Effect"? Goes something like: A
butterfly flaps its wings in China and the resulting
wind currents and eddies cause crop failures in the USA.
There's also the "For want of a nail a horseshoe was lost.
For want of a shoe a horse was lost. For want of a horse a
rider was lost, ..."

The teaching credential set in motion a goofy chain of events
that ended with 'the little woman' finding my Cybiko. I
guess its just me but I find that type of causality
interesting. I'm a slave to serendipity.<grin>

I've found recently that I don't just miss some of the
older stuff because of nostalgia, but because there
were practical needs that were served by old hardware
that aren't being addressed now. Cell phones are
coming close though.
> So, you take the test, pass it, now are you ready

It'll be another couple of weeks while the state
does a back ground check before I'll get the
credential.

I hear what you are saying about the current state
of the school system. California is so bad they are
trying to recruit teachers from the mid west. We are
rated something like 48th out of 51 states in education.

The joke was the California Teacher's Association<the union> had the saying "Thank heavens for Mississippi!" about 10 years ago as Mississippi was the only state that consistently scored lower then California. The irony is we are now ranked below Mississippi.

I don't expect to do well, it is just I am expected by family and friends to try. I'm pretty good dealing with failure. Three members of my family are/were teachers and one gave it up because of the problems with students like you mentioned and autocratic faculty.

I am sort of qualified IMNSHO to teach most subjects except English, a foreign language of any kind, and history. I have had literature courses through the graduate level but I suck! I've had a year of both German and Spanish but forgot everything I ever knew. It isn't easy taking 200 college units and only having a bachelors. You got to take a lot of stuff outside your major!

Strangely enough, my Sister in Law who was a phys ed major ended up being a history teacher. I could fumble my way through most science, math, shop, type stuff w/o too much trouble. I wouldn't mind coaching a sport a bit either. Figure I am close enough to collecting social security that I don't have enough time to make it a real career.

Starting pay for a teacher sucks so bad I can see why they are having problems. You need to make ~$160k/year to qualify for the average California home. Starting pay for a teacher is only ~$40k/year so no one in their right mind would take a job here. Pay is 20 years behind the private sector. I mean illegal alien day laborers typically get $80-$130/day. Substitute teachers with their degrees, credentials, and legal status only get ~$125. Since I am not of a right mind, I am a perfect candidate!

Rick

One thing I've noticed is the large amount of whining going on in these groups about the cost of classic computer items. I don't know what people expect, but I expect that the majority of people have no clue how much old stuff is worth, don't want to be bothered with figuring it out, and definitely don't want to be bothered with selling it in any way more complex than a yard sale. So, I would say 95% (or more) of the classic computers sitting in closes the last 20 years have made their way to the local landfill. Given that some things like Atari 1200XL and Commodore Plus/4 systems didn't exactly set sales records, I find it amusing (and a little annoying) when people complain about the prices these now rare items fetch on eBay.

Personally, I see a hobby--any hobby--as a way to spend money to get pleasure and have fun. We certainly don't collect classic computers for the economic benefit because even if you can sell an item for 100% of your acquisition cost on eBay, most of the items you can do that with are so rarely available that you can't sustain an economy on such activity. So, you have to think about __why__ you collect older computers and whether or not your budget and lifestyle can support that hobby. Collecting Commodore 64s is a lot cheaper than collecting Atari 1200XLs. Why? Even if 95% have been chucked in the garbage, 5% of 22 million is still 1.1 million samples available. I would imagine the number of 1200XLs available numbers in the thousands, if not hundreds.

If you cannot afford this hobby, you should consider something a little less economically taxing. I can understand the love of the computers and the experience, but almost everyone has a PC and the emulators are so good for these classic computers that anyone who's financially strapped could get just as much usage enjoyment from emulators as with the real thing. If you've got to touch a machine to be happy, then you need to figure out a way to make the economics work for you and deal with the reality that any item is worth what its purchaser will pay for it. If a PET goes for $1700 on eBay, then that's what that PET was worth.

I'd give $125 for a functioning (with all connectors) 1200XL. I'd give $200 for one in great condition in its original box.

If that was a case we wouldn't have a stock market. The stock market's whole premise is to set and track the value of a share of stock of each listed company. If I pay X, and you are willing to pay X+1, then the new price is X+1 and the index goes up. If you can't sell it at X+1, then the stock becomes devalued to X-D where D is the devaluation of the stock.

The point is that you can't whine about a stock being $100 a share when you think it should be $20. The same holds true for every other product in a capitalist society.

And the point of your post was??? As far as I can tell your advice to everyone is that if you can't afford to buy things at ebay prices, then go do something else? Wow, thanks for that little nugget of wisdom. I think my life is now complete...

On a side note, I don't recall too many people here complaining about prices. Maybe the odd "Why does an old Apple II go for so much?" type of thread, but that's about it. Aside from original Apple II's and maybe some of the Applied Engineering cards, Apple II collecting is actually pretty cheap.

No, the problem is that certain "collectors" like to buy up every single SX64 or other collectible item that they can find at average prices, and then list them one after another or even at the same time at very high prices.

What this does is effectively make it *LOOK* like these computers are worth is a lot more than they really are (whether they actually sell or not). Other sellers see the auctions and think that they too should list a C128 for $269. It's obvious they are trying to over inflate prices so they can turn over old hardware rescued from a dumpster or good will for fat profit.

Personally I find $200 for a 1200XL "in great condition in its
original
box" rather cheap. Its ok to try to negotiate a low price, of
course... ;-)

Also I thought you might find this amusing:

If you are buying stuff on eBay, and you don't look at the actual selling prices of items, then you are the problem, not the seller.

It's been many years since I've seen Commodore, Apple or Atari hardware at a Goodwill. Thrift stores have typically caught on to their value and don't even bother trying to put the items on their shelves, it goes straight to eBay. Yes, you an occasionally find a nugget hidden away by a hermit, but it's the exception and not the rule.

And, just for precision, the selling price of an item on eBay is set
by the *second highest bidder*, not the highest bidder.

BTW, this thread is much less relevant to the comp.sys.apple2 group,
since I see practically no whining about prices here (maybe some mild
amusement about every month or two). Crossposting a thread like this
(with an emotional level of 8 on a scale of 10) seems more like a
troll than a post. Each old computer's market is quite different
in its dynamics, so, if necessary (?), it would have been better to
introduce this question *separately* to the various forums, rather
than crossposting.

As it is, I expect a small torrent of postings to csa2 that are almost
totally unrelated to the Apple II or its "marketplace".

Future responders may wish to consider "turning off" some of the
crossposting...

Ultima stuff has been very collectible for a long time. The big box
version of Ultima][in this condition I would expect to fetch the
$493.88 that it received.

To be fair, I've noticed a slightly higher level of maturity on the topic in c.s.a2, but the post was meant more as a retro-collector topic than a topic specific to any one machine or newsgroup.

Are the Ultima games really worth that much?

Might be time to sell mine and retire. I have Akalabeth, Ultima (before it was a
One), big box Ultima 2, Ultimas 3, 4, 5, 6... All but six is for the Apple. All
the bits and pieces too. I even have the poster that was in one of the computer
magazines.
I also have Martian Dreams. I really liked that game.

My whining is not so much what others are paying for their
Commodore stuff, Its just that I can't find *that buyer*. Recently,
a SCPU128 installed in a flat C128 went for over $1100 on EBAY.
About 10 years ago, I sold roughly the same item for $300. At the
time, I was stupid enough to be glad that I got that. Sombody paid
$60 for my AMIGA 500 with an with mouse, original work bench 1.3
disk, external disk drive, and an AMIGA 1200 baud modem.ten minutes
later somebody sold his A500 with over a hundred games for more thaqn
$150. How come that guy chose to post his item 10 minutes after I
posted mine? Our items reduced the price of the other guy's item.

It's NOT FAIR!!!

I NEVER have no FUN!!!

While we're being fair ;-), I note that the Apple II community is quite
distinct from the C64 and Atari communities, with only occasional points
of contact that tend to be quite pragmatic--like 6502 interfacing or
mutually relevant documentation.

This is why I suggested separate posts to relevant newsgroups, since
most market-related discussion will not be relevant to other groups.

Yes, Ultima games are very popular for collectors. The CPC version of Ultima, in good shape can fetch in the $1000 range these days. Either one of the two versions of Akalabeth that CPC released for even more. However the Holy Grail of Ultima collecting is the self-published version of Akalabeth that Richard Garriott sold on his own when he was in high school. He only made about 20 copies.

I have also noted the recent absence of older computer items from
the local thrift stores.

However, they seem to be going straight to electronics recyclers.
They are deemed "obviously worthless" since you can't surf the web
with them. ;-)

Only a tiny percentage of donated old machines ever find their way
to any "marketplace".

Actually only the Canadian numbers would have cost me. :) Not too bad. I really want to find a dialup Atari BBS, but in the meantime we are blessed with about eight Atari BBS's over telnet. And after the last busy week and before the next busy week, I will try to jump in tonight and see how everyone is doing. ;)

Do what I did - post to the relevant newsgroup and go through
responses to try and find someone that is not collecting them for
resale or closet storage. I've got too many C= 64's and would gladly
sell some except that there are too many of them on the market; the
Vic20 package though - maybe not.

If enough of a given group (atari, apple, commodore) start bypassing
ebay and sell their stuff reasonably of with additional conditions
(eg: good home) then this problem will go away.

Actually retro computing needs to be seen like antique car collecting. When I see a model T on the road on a night day where people go cruising that is about how I feel taking my Atari 800 out onto the internet.

Not a cheap hobby, but fun.

He was talking about Duke Nukem *3D*!!!

Yeh, you know, such a game, once you got past the loopholes you'd have to
jump through converting a game usually on a low end 386 to a high end 8-bit
computer... you could probably put this on a 8-16 mb compact flash card that
could be plugged into the MyIde/compact flash-IDE converter combo that many
8-bit Atari users are using these days. :) To matter the fact many
complex LARGE image games could be sold this way.

And why hasn't anyone hacked a DAT player to work on the cassette channels
yet? Think of all the days of music you could pipe in that way? :D

I'm pleased to report that I've found an uncorrupted, working copy of
Millipede on one of my floppies (unfortunately while packing up all
kinds of stuff to move out of my home to take a new job). I took a
moment to place it onto an MS-DOS floppy (g-- bless Bob Puff and the
Black Box!) and hope to rework at least -that- part of Games003.atr
when I get to the new digs. Unfortunately the new digs will be
temporary so it will be -at least- three-to-six months before I can
even SET UP the Atari-with-BB again -- and then we'll find out if it
survived the move. If it doesn't, I may need to recruit some of you
(esp. with HD interfaces or other path-to-Windows) to image some of my
>1200 floppies... :-) Anybody here in the Central New York area?
I'll be in the Canastota/Cazenovia area unless something changes
drastically.

wrote:
> One thing I've noticed is the large amount of whining going on in these groups about the cost of classic computer items. I don't know what people expect, but I expect that the majority of people have no clue how much old stuff is worth, don't want to be bothered with figuring it out, and definitely don't want to be bothered with selling it in any way more complex than a yard sale. So, I would say 95% (or more) of the classic computers sitting in closes the last 20 years have made their way to the local landfill.

Funny you should say that. I just threw out a *HUGE* number of items
in the last two weeks since I am forced by circumstances to relocate a
4-bedroom household into a 2-bedroom apartment. Given more time, I
might have gone to the trouble of offering various items for sale,
but my experience on that point over the last ten years has been
firmly that "it's not worth the effort." People mock me for even
having this stuff, let alone for actually *using* it, heaven forbid
enjoying it. I know I'm not the only Atari/Amiga/VAX/VMS diehard
out here, but it sure seems like it sometimes, and that's
discouraging.

> Given that some things like Atari 1200XL and Commodore Plus/4 systems didn't exactly set sales records, I find it amusing (and a little annoying) when people complain about the prices these now rare items fetch on eBay.

Do I even want to *know* what an Atari 800XL or a 1050 disk drive is
selling for, these days? :-(I haven't QUITE gotten to the point of
throwing those away -- I have a 130 XE with Black Box that I need to
make sure I have a backup for, for a while yet -- but the last *I*
heard, about eight years ago, was that Atari computers were going for
a quarter -- yes, twenty-five CENTS -- at thrift stores. Since then,
even the thrift stores, VOA, and Salvation Army have been refusing to
take computer items more than just a few years old; the only things
they'll take, apparently, are those that can be sold as "relatively
modern" Windows PeeCees.

So has that turned around? If so, when did it happen? I don't have
the time, myself, to hang around eBay (or here, usually, for that
matter) to keep tabs on the industry.

I think you are going to be a substitue teacher.
All those hours you have, probably don't include
enough education courses to qualify as a regular teacher.
I was a sub. You will be interviewed by a school
system administrator. Then you wait for the phone
call at 6AM to what school you are going to. I didn't
get much primary school assignments, the kids put
chalk on my shirt and generally ran amuck, and I didn't
teach them anything, just sort of watched them for the day. You'll have a
choice of joining the union, unless
it is a closed shop. I joined the union.
High school kids behaved some better. Maybe because
I was 6'3" and 220 pounds and a reach of 4' or so.
Good luck with it.

Sorry... but this sounds like a big whine. "No one wants to pay me
what my collectibles are worth."

It's you hobbyist collectors that are killing the hobby. No one can
get in and see what the nostalgia was all about. You can't put
together a working system cause some fanboi has stocked it all away in
attic/basement/closet and wants you to pay and extra digit in front of
the decimal point for the privilege of having it finally break in your
hands. That means people like me will eventually LEAVE the hobby, and
you're going to be left with the 5 to 6 of you who have collected
everything trying to rip each other off. Eventually you'll die and
there will be NO ONE LEFT who knows or cares what these "Commodore's"
were.

I've seen CMD HD's and RAMlinks go for more than entire modern PC
systems. I'm wondering what kind of moron pays that much for something
that can't be fixed.
Maurice STILL has my RAMlink that I sent him in 2004. I'm NEVER
getting that back, so what's the point?

Hell... Maurice was the ultimate Commodore "Collector/Hobbyist". He
'Collected" CMD and killed it. You should worship him. Now your 40MB
Hard drive will be worth more than a New Mac Tower, as long as it
runs.
As far as supporting the community, Maurice was a nail in the coffin.
Any hope that we might be able to keep our stuff running died when he
buried CMD in his private collection.

I've been looking for a 1750 for about 4 years now. Without one...
it's just not worth my actually keeping my Commodore collection
usable.
The MAX I intend to go for a 1750, or expanded 1764 is $75.

512K for $75 is ridiculous. I can get 4GB flash drive for that now.

My collection is shelf junk, and very soon, I will be getting rid of
what doesn't hold any real value for me. THE INSIDES!!!!

I can't even find reliable 5.25" floppies any more, so what good are
my 1571's? They make great MiniITX project boxes... that's what.
Same for my old Commodore 64's and 128's. I'll make a bunch of core2
duo system in old Commodore cases and hide my PC hobby in nostalgia
plastic.

You've "collected" me out of the hobby keeping a working C= and
eventually it's going to get about 7 vintage machines shelled and

tossed.

Any one want SX-64 innards? I bought a semi busted one to turn into my LAN box. Make me an offer, and pay shipping.

You guys wanna horde like dragons, you're going to face the same end. Extinction. Your "horde" will be buried or pilfered in the end.

Supporting your hobby doesn't just mean buying it all up. It means keeping it alive and letting people get the Commodore Experience. When you untighten your grip, you may get some new blood. Otherwise, you'll have the honor of the owning the last C= and people will laugh at you cause their cell phone has better graphics.

Hmm.. Lots of opinions here.. I'll state mine.

First.. simple economics. The value of ANY ITEM is whatever the highest price somebody is willing to pay for it. If there is only one person willing to pay $1,000 for a Vic-20, then that is the value of the Vic-20 at that time.

For me.. I like to collect stuff but only what I personally need.. there are several reasons for that..

1) I don't have the money

2) There is NO POINT in trying to preserve as much hardware as you can. I know that my children aren't going to ever feel the same way about Commodore stuff as I do. At some point in time, the stuff is going to get thrown out, even if it is after I die. At least most of it. So why fill my house with it today? and of course..

3) Much better to use the space for something else.

Now, I wouldn't mind having an SX-64. That is about the only thing my collection is missing. But I'm not generally willing to pay the price to aquire one. If I found one for $50 or less, I might reconsider. However, that is unlikely as there aren't many left in existence (only a few thousand were made, right?) and their value keeps going up, not down. I'd also like to have a flat 128 (I have a 128D, but not a flat one) but I just keep holding out for one at a flee market or garage sale or something.

I think you're confusing collectors and speculators. The former aren't hurting anyone. Their collections are labours of love and you shouldn't begrudge them their hobby. While you and I might not be willing to pay such large sums for retro computers, they are. Such is the benefit of a free market economy. As for your arguement that collecting will result in the extinction of retro computers, it's the worst kind of hyperbole; that spurred by sour grapes.

For those on nostalgic kicks, emulation offers an easy and inexpensive way to relive one's (misspent) youth. The availability of such emulators is boon to both the collect and the interloper and further weakens your argument about extinction.

As for speculators, they're a byproduct of the free market economy that I spoke of earlier. Parasites exist in all ecosystems and there's little that can be done about them.

I wonder what you'll do when (if) you liquidate your remaining original hardware. Will you sell it for a pittance to a newcomer or will you sell it to the highest bidder (who will most likely be a collector or worse, a speculator)? Yeah, I thought so.

There is a general rule of thumb that says don't draw more then 200 amp
from an Atari. They burn out power supplies as it is so that would
definately be my upper limit w/o switching to a different power supply.

:-) Anybody here in the Central New York area?

By coincidence Steven Tucker (of APE fame) won an auction from me for
a dead 1200xl - so I was able to get a copy of APE back (I registered
years ago but lost it to moving a couple times/hard drive crashes).
EVENTUALLY, when I'm done going through all my back atari stuff, I'm
keeping at least 2 systems so I'll be able to furthur the archive
cause.

If any of the 1200 disks need to be cracked I can help you out there
as I still remember how to use Omnimon and one of the systems staying
definately has that in it.

Are the 1200 discs duplicates of things that are already archived?

Very true. All I can say is that it pays to make friends with the people who decide what's "obviously worthless." A few years back I got to be pretty chummy with the computer guy at a local thrift store. I let him know that I was interested in old computers/technology and he'd save stuff for me that would normally have gotten recycled. Every few weeks I'd stop by and he'd show me what had come in. Usually it was nothing much, but there were a couple of times where I scored some real gems!

Message-ID: <AFSQh.116325$Ko5.94716@newsfe08.phx>
Source record: 4789

Hi,
Setting lomem in turbobasic locks up:

```
5 REM COPIED FROM MAPPING THE ATARI by Ian Chadwick
10 ? FRE(0):BYTES=192
20 MEMLO=BYTES+PEEK(743)+PEEK(744)*256
30 HYBYTE=INT(MEMLO/256)
40 LOBYTE=MEMLO-(INT(MEMLO/256)*256
50 POKE 743,LOBYTE:POKE 744,HIBYTE
60 POKE 128,LOBYTE:POKE 129,HIBYTE
70 POKE 8,0
80 X=USR(40960)
```

and then I have to reboot. This works with AtariBasic "C"

This is supposed to restart the interpreter, but Turbo BASIC XL does not reside in the same place as the Atari BASIC. Check the values of APPMHI ($0e/$0f) and MEMTOP ($02e5/$02e6), that will help you to understand why jumping to $a000 is not a good idea in Turbo BASIC.

I bought both of mine for about $50 on ebay. no boxes or other stuff, just
a power supply. Both worked, but one had some bad keys on the keyboard. I
replaced the keyboard on that one.

huh..... what makes the 1200xl so desired? Is it because it's the
"largest" with the real keyboard so most comfortable to use?

Keyboard is actually ~the same size. It is one of the best keyboards of course.

It is kind of the '57 Chevy of computers, that is it was an OK computer when it came out but is really desirable for modifications. For instance it is fully socketted so upgrades are almost plug and go vs. "Unsolder the 8 RAM chips" type of stuff.

BUT it does have problems unmodified. The video is the worst of all the 8 bits and it has a resistor in the SIO 5V supply which makes it unusable with things like the PR:Connection. The cartridge port is too small/tight to fit a SDX cart.

The rariety thing probably comes into play too. I mean Atari did not make a lot of them in the first place and you have hackers competting with collectors for them.

I sourced a complete one in the box from Atari Max. They are also installing APE Warp+ in it for me and so I'm going to be tickled pink when it gets here. :)

Actually, no. I "like" them because they run ALL the 400, 800, & 1200
Software and Cartridges perfectly WITHOUT ADAPTERS or CONVERSIONS of
any kind.
I "need one" so I can do my R&D for "8-Bit Designs" for NEW ATARI
Interfaces.

Thanks,

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

I give my dogs a worm pill once a month to eliminate parasites. :-)

Now, if we could develop a once a month post for the retro-systems newsgroups
that would have the same effect...

In my experience, the "parasites" you are talking about don't
visit newsgroups. They just watch eBay.

Most participants in csa2 are interested in using their machines,
not in selling them.

> 10 ? FRE(0):BYTES=192
> 20 MEMLO=BYTES+PEEK(743)+PEEK(744)*256
> 30 HYBYTE=INT(MEMLO/256)
> 40 LOBYTE=MEMLO-(INT(MEMLO/256)*256
> 50 POKE 743,LOBYTE:POKE 744,HIBYTE
> 60 POKE 128,LOBYTE:POKE 129,HIBYTE
> 70 POKE 8,0
> 80 X=USR(40960)
>
> and then I have to reboot. This works with AtariBasic "C"
```

Try this program:

```
10 REM this program is saved as AUTORUN.BAS
20 MEMLO=$02E7:LOMEM=$80:INITBAS=$0470
25 _MEMLO=$3BFC:REM this is your new MEMLO, normal value is 13865(=$3629)
30 IF DPEEK(MEMLO)<>_MEMLO OR DPEEK(LOMEM)<>_MEMLO
35 DPOKE MEMLO,_MEMLO
40 DPOKE LOMEM,_MEMLO
45 RUN "D:AUTORUN.BAS":REM place name of this program here
50 ELSE
55 X=USR(INITBAS):REM this initializes TurboBASIC XL
60 RUN "D:PROGRAM":REM place name of next program here
95 ENDIF
```

So to reserve 192 bytes you would set _MEMLO=13865+192.

I used the above program to install device handlers. One was a memory handler that accessed the 1MB of ram I hand in my 130XE. If you have any questions about the example, let me know.

That's not actually true. Software that makes direct jumps to routines in
the 400/800 OS instead of using the vectors will not work on the 1200XL
without running a "translator" disk, which basically puts an 800 OS in RAM
under the stock OS.

> I "need one" so I can do my R&D for "8-Bit Designs" for NEW ATARI

Get yourself an 800XL, cheaper and easier to come by.

I think it has to be MouseTrap.

God how I hated that game. And then Star Trek came out.

624. Community Report, 2006

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-07 14:59:21 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2007.04.07.14.59.21.623216@charter.net>
Source record: 4659

When I restarted the DarkForce! BBS, it was for the
same reason that I first started it up in the early 90's.
Namely, to contribute to, participate in, and give back
to, the Atari community, all that I've gotten from it.

With that in mind, here is what DarkForce! did in the
year 2006:

January 2006
1. $25.00 - Slor
2. ST Mag - Doc Rotcod

February 2006
1. $25.00 - Morden
2. ST Mag - Showa

March 2006
1. $25.00 - Mark Chitti
2. ST Mag - Arch Mage
3. DGS 8Bit CDROM - Stephen

April 2006
1. $25.00 - Slor
2. ST Mag - Sthelir

May 2006
1. $25.00 - None (rolled over to next month)
2. ST Mag - J_D
3. PEST - Zeptari
4. USBcart - almostrice

June 2006
1. $50.00 - None (rolled over to next month)
2. ST Mag - DocClu

July 2006
1. $75.00 - AlmostRice
2. ST Mag - Pantera

August 2006
1. ST Mag - Gemini8

September 2006
1. ST Mag - Wulfie

October 2006
1. ST Mag - Dew_it

November 2006
1. ST Mag - Sauron

December 2006
1. ST Mag - Callaghan
2. Mega STe motherboard - Doc Clue
3. Guderian (8bit game) - JeLLe

Glad to be of service, folks! :)

If you have a monitor like Omnimon or the emulators you can look at
memory - peeking will just return numeric values which could
correspond to ATASCII of course.

Some I've seen over the years:

Pharaoh's Curse: SYNISTOPS (That's the level 3 code)

Alley Cat: Why did the pirate chip his teeth? He was trying to blow
the vibrator. (Or some thing similar!)

Thanks to Pharaoh's Pyramid, which unlike Electronic Arts games which
just said "REMOVE CHIP AT $C000" in the disk sectors, Pharaoh's
Pyramid named the chip at $C000.... Omnimon. Made us wonder what's
this omnimon thing......

Hmm, don't know about the 8bit, but the Amiga certainly had some (some of the same 8bit programmers) and the ST had this (from Wikipedia):

"The standard 8x8 pixel graphical character set for the ST (the main in-ROM "font" for GEM, and text-mode TOS operations) contains, following all the standard numbers, letters, symbols and accented characters, four unusual characters. These can be placed together in a square, forming a basic but recognisable facsimile of the face of J. R. "Bob" Dobbs, the supposed founder of the Church of the Subgenius"

I think I remember accessing the face from within Atari ST BASIC, but I always thought it was one of the Tramiels. :)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS

Hi,

I'm looking for information (best a scanned handbook/documentation, or list of possible commands) for the Atari Calculator Program (from 1979, Article CX8102). This might be the same software as APX 20130, but I'm not sure. Can anyone send me information on this?

Best regards

Carsten

633. NTSC carts on PAL system?

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-08 11:52:37 UTC
From: Gareth <hotmail.com@dgareth.spm>
Message-ID: <4618d750$0$21841$db0fefd9@news.zen.co.uk>
Source record: 4668

I've asked this question before - a few years ago - and the answers were helpful but a bit confusing. I'm considering buying some NTSC Atari 800 game carts for a PAL system - the PAL carts are more difficult to obtain.

When the Atari 400/800 were marketed in the UK the advice from Ingersoll and then Atari Corp was clear: NTSC carts will not work on PAL systems.

I've heard however that this isn't true and that the NTSC carts will work - that there is actually no difference at all between the hardware or software of the carts.

Can anyone confirm this with any certainty - will NTSC carts work on a PAL system? Has anyone used NTSC carts on a PAL system with success?

Gareth.

I have not come across any cartridge that did not work on PAL machines.
There's a problem with some Atari 800 games on XL/XE systems, I think Demon
Attack and some others that need a translator.

Also, I know some demos (not talking cartridges here) and games written for
PAL machines won't work on the NTSC ones, because of the difference in
50/60Hz and the time available in the VBI.

So, NTSC isn't the problem, being an older cartridge, might be, because of
some difference in addresses in the hardware.

Anything special you look for?

Thanks for the information. It's odd (and, it turns out, very misleading)
for Atari Corp to have said that NTSC carts wouldn't have worked on PAL
systems.

Yes, I'm looking to replace my entire collection that was damaged some years
ago! Some carts are pretty difficult to find although they do appear on eBay
from time to time - Donkey Kong Junior, Popeye, Necromancer and many others.
They are mostly sold by people in the US. Often the shipping cost is more
than the cart and, for an expensive/rare cart, the customs duty and
collection fee makes it even more expensive.

Gareth.

636. FS: Atari Colletion

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-08 12:19:05 UTC
From: Rob K <chibigguy@hotmail.com>
Message-ID: <Xns990C4A78FD47Erobknautzcom@208.49.82.220>
Source record: 4671

It is with great sadness that, after years of saying I would do something with this stuff (haven't done anything serious with it in 10+ years), I need to part with my collection of Atari stuff. Got my 400 in 83 or 84 and had a lot of fun all the way through college where I added to my collection through a box of stuff found in a house I moved into (XF551, XM301, Apefaces) and benefiting from the University selling off their old atari stuff for $10 per item. There were actually professors still using them in their offices for word processing in 1990 even though the university had a massive deal with AT&T for PCs and Unix boxes.

I'd prefer to unload the whole thing at once and not have to ship anything. Therefore, if there is anyone in the Chicago area (or within a 4-5 hour drive), I would accept a reasonable offer and deliver on a weekend day. Otherwise after May 1st, I'll accept reasonable offers on parts of the collection.

Rob

Here is what I have:

(1) Atari 400 (48K upgrade (Axlon?), case has seen better days)
(1) Atari 800 (one or two keys are loose but functional)
(1) Atari 800XL
(2) Atari 1200XL

(2) Atari 1050 (no enhancements)
(1) Atari XF551

(1) Atari XM301

Have the power supply for the 800, think I am one short for everything else though.

(3) Apeface Parallel interfaces (never got them working, not sure if they work)

(2) Gemstick Joysticks
(2) Wico Bat Joysticks with changable grips
(1) Other joystick

Ton of disks that probably don't work
Books (incl. Compute's First & Second, First Book of Games)
Atari Writer Cart
Visicalc Disk (don't remember if I ever used)

Cartridges, most in poor shape, but functional:
Buck Rogers
Krazy Kritters

Gorf
Aliens (?? not sure label is missing)
Galaxian
Asteroids
Jumbo Jet Pilot
Soccer
Basic (for 400/800)
Qix
Donkey Kong
Star Raiders (of course)
Pac Man
Centipede
Kickback

637. Tico-Tico or Tiko-Tiko in BASIC

Back when I was a wee lad I had a song called Tico-Tico or
Tiko-Tiko...can't remember.....that was written in BASIC. I recieved
it on a local Atari Club monthly disk, so not sure if it was just a
local thing. It was a really catchy tune, so I am hoping someone may
have come across it and can help me get a copy.

Thanks,

Aaron

That's correct, as well as the 7800. The 2600 do play the games, but often with pink superman or smurf, so the colors are off. 7800 games just doesn't work. 5200 is of course only NTSC, never released in Europe, so they are no problem.

AWESOME!!! Thank you so much. I just had a majhor nostalgic moment,
and it stopped my 4 month old from crying. :)

Though it seems a little slower than I remember it. Sounds about
right when I kick the emulator up to 115%-120%. Maybe I am just
remembering wrong.

Well, "Easter Eggs" aren't that unfrequent, actually. I don't know
whether the
Atari had any easter eggs that were added on purpose, but for example
the last couple of bytes of the Rev.B Atari Basic contains characters
that look like a high-score table of sorts. ("Winner" in Atascii code!)
Probably the author played a game before making the final cart dump for
production. (Rev.B is the damaged version with broken memory copy
operations that hangs up from time to time, thus the "looser" edition.)

The AmigaOs had a couple of them, too, but that's off-topic.

So long,
Thomas

(And Happy Easter, this fits perfectly!)

Cool, thanks. Didn' t know about those. I'll add them to the list:

http://www.digitpress.com/eastereggs/

Do you or anyone else know of any that aren't listed there?

Btw, the Alley Cat message is Q: Why can't a pirate use a dildo??
A: Because it chips his teeth."

And Pharaoh's Curse has "By Mike Potter" listed twice in the code,
which is strange since the title screen says "By Steve Coleman"

I just checked the Rev B rom in a hex editor and it shows ",7inner".
Not sure what to make of that. The other revs don't have text at the
end.

In ASCII, not in the Antic character encoding. In Antic's encoding
that's "Winner". (-:

Maybe on a NTSC machine it runs faster? Is you emulator set to PAL or NTSC?

Or maybe you ran it in Turbo Basic? Or compiled?

I got my 1200XL today with APE Warp+ installed. I'm happy, very happy. I think my 800XL has a problem because the 1200XL plays more games from the Spudster collection than my 800XL would. I'm also very happy with the APE Warp+ OS that is the default OS with the add-in board, it's fast and it appears to be very compatible with 800 software.

I'm actually HAPPIER with this purchase than I thought I'd be! The only thing that bums me out is the joke documentation that Atari included as an owner's manual. Other than the special key combination page it's useless.

There's a ton of really cheap 800XL available on eBay right now and there's even a couple of 130XE that are going for about $50. If I hadn't just bought this 1200XL I'd be all over one of those 130XE systems!

No, I was in NTSC. The version I, had all those years ago, may have
been tampered with before making it to me, or this one may have been.
Or I am just not remembering it correctly.

In both Savage Empire and Martian Dreams, the "Worlds of
Ultima" Origin games, the following text can be found in the
file GAME.EXE: "Winona Ryder is a really hot babe"

I don't know if it is possible to actually get this text on screen,
though.

A quick Google search says that these people found it, too:

I can't remember offhand, but is there a way to disable the keyclick from the internal speaker on the 800 short of disconnecting the speaker? I know you can on the XL/XEs, but couldn't recall a software method to do this on the 800.

Thanks.

The only software method I could think of is to replace the Os K:
handler (at least partially) not to call the keyclick routine.

So long,
Thomas

I don't know if it works on an 800 internal speaker,
but 731 0 click, 255 no click. I have in my notes.
Maybe that just works on XL/XE monitor clicks.
Give it a try and let us know if it works, please.
POKE 731,255

That's the XL Os only. Os/A does not check for this location,
unfortunately.

So long,
Thomas

660. atari++ 1.52 released

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-10 15:31:25 UTC
From: Thomas Richter <thor@math.TU-Berlin.DE>
Message-ID: <581oudF2egcftU1@mid.dfncis.de>
Source record: 4695

Hi folks,

a new release of the C++ based atari 8 bit emulator has just been
released. You find it at its web page at:

http://www.math.tu-berlin.de/~thor/atari++/

Credits for this release go to Waldemar Pawlaszek for detecting
and fixing several bugs in the 65c02 emulation code, thus the
CPU emulation for the advanced member of the 6502 family has been
reworked heavily.

In addition, the interface to the monitor/disassembler has been
reworked as well to ease the integration of other members of
this family.

Have fun,
Thomas

Yeah, I tried 731.

Location 731 was listed in the XL/XE addendum to the Atari memory map. I tried putting non-zero values in there anyways but they have no effect on the 800.

Maybe I should just put a potentiometer on the speaker wire so I can adjust the volume.

Thanks.

-Jason

You're remembering correctly.
The one you remember has Antic turned off.
You can modify ticotico.bas like so:
1 X=PEEK(559):POKE 559,0
222 POKE 559,X
Now it will play almost twice as fast.
TICOTICO comes on a 'SuperSynthesizer' demo
disk with about 15 other tunes, and it disables
Antic.

Actually, the incompatibility problems were so bad with older 400/800
software that the running joke was the 1200XL was the only computer
that was incompatible with itself ;). The 600XL and 800XL weren't
much better, which prompted Atari to issue free Translator disks
(which contained 2 different versions of the 400/800 OS - A and B).

http://rtdos.com/tiki-index.php?page=The+BASIC+Language+Retropedia

working on a retropedia of sorts for the basic language; what we are trying to do here is create a xref system of the different commands each dialect of basic used and how each dialect of basic used them. we're trying to cover all basics for all machines (from the first machine that used basic up until as recent as possible or feasible); back in the early to mid 80's there were TONS of books on the subject and we're trying to re-create that here (since most other classical computing sites contain information on the various machines we are trying to gather programming information on these machines so, no, we're attempting to NOT duplicate the same information on other sites although we'll link to these sites when necessary, possible, and or allowed by these other sites).

Hello All,

I have an overstock of Atari 8-bit to RCA/Phono TV cables (2 metre/6.5')
which I am clearing. Prices start at just ?1.50 delivered. This offer is
only available to readers of this newsgroup, so you will need to visit the
offer page directly:

http://www.dgs.clara.net/RCA-a8-Apr07.htm

Payments are by PayPal only in UK Pounds. Payment buttons are included on
the page, or you can PayPal the money directly if you prefer. Cables can be
shipped to the UK, Europe, USA/Canada, and Australia/NZ.

I have other types of cable too, which are sold through eBay:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

Or, for US users:

From: Jason Harmon <jharmon@us.net>
Message-ID: <nvKdndTGeL2OQb_bnZ2dnUVZ_v6tnZ2d@comcast.com>
Source record: 4709

I recently aquired a 512K Axlon caompatible memory board for my 800. The only problem I've noticed thus far is that BW-DOS hangs during bootup when the board is enabled. It has a switch to disable access to the extended banks and act like a normal 800, and when this option is selected it works fine.

Does anyone else have an Axlon type memory expansion for their 800, and do you also get this behavior under BW-DOS? If so, are there any patched versions that work with Axlon type boards (and maybe support it as a RAMDISK)?

Thanks.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

Something like that Axlon expansion would have a driver wouldn't it?
Have you got the driver or instructions to tell you whether there's a
driver?

Cheers for using BeweDOS, the great low overhead command line DOS for
Atari 8bit.

680. Re: BEWE-DOS and Axlon Memory

Actually, there is no driver for accessing the Axlon memory (mine is a Magna Ramcharger, but it is Axlon compatible).

The Axlon model is similar to the 130XE method of bankswitching, in that the bank from 16384 to 32767 is swapped with 16K banks of extended memory. However, instead of a few bits from PORTB being used to control bank switching like on the 130XE, the entire byte at location $CFFF (53247) is used as a bank control register. A value of 0 means the main/normal bank is active, and values from 1 to 255 cause an extended bank to be selected. Since my board is 512K, banks 0-31 are valid. This method can support up to 4MB of RAM, where values of 0-255 would be valid.

$CFFF is available as a bank control address because on the original 400-800 memory map, the 4K block of address space from $C000-$CFFF (49152-53247) is unused. When the XL OS came along, this address space was used by it and these locations were no longer available for such purposes.

I'll be trying to send a 23k zipped Axlon.atr to you by email which
has 315 sector docs file from Axlon on their board which banks from
CFC0 thru CFFF and has a mirror for that banking register at 0FC0 thru
0FFF which is right in the middle of DOS. YIKES!!

Thankfully my 'compatible' is NOT banking at 0FC0 thru 0FFF as the
Axlon does but mine does bank at CFC0 thru CFFF just fine. Mine is a
128k custom home rolled and does lock up booting 1.30 BW-DOS with the
memory switch OFF. Don't ask me how or why, I don't understand it
either but since mine does maybe you have your switch orientation
backwards too?

In the Axlon atr is SpartaDOS 1.1's RdAxlon.com which only supports
drive 1 thru 4 at the size of 128k only, that's the ONLY Axlon ramdisk
driver I know of, I'll try to put something better together. Support
for Axlon on MyDOS is not good enough either which I'll also try to
fix with another version of MyRd2.AR0 posted for download at Mathy's
MyDOS page.
http://www.mathyvannisselroy.nl/mydos.htm

Anybody else want the zipped Axlon.atr file just post your munged
email address such that I can figure it out or contact me at

lee_454_AT_yahoo_dot_com using AXLON in caps for the subject line.

Thanks for the info and file Lee.

Actually, I have an original copy of SD 1.1, and that along with its Ramdisk driver works fine with the board (but limits the Ramdisk to 128K) under SD 1.1. If you have SDX, it would be interesting to see what that does.

Since my board has 512K (32 banks), your are correct that bank values of 32-255 repeat 0-31, since the upper 3 bits of the banking register are ignored. Only on a 4MB board would 0-255 each address unique banks.

I don't think the switch orientation is backwards. When extended mem is turned off, BW-DOS works, but the machine is only a standard 48K 800 at that point. When turned on, BW-DOS hangs.

The "Stereo Sound" music demo would play on the TV speaker and the keyboard speaker. And yeh, on my 800 I've had a three position switched added for no sound, normal sound, and loud.

Just chiming in... not really adding anything new to the conversation. ;)

Oh yeh, Ice-T and Flickerterm have an option to kill the keyclick if you
want to. So there is a DEFINATEKLY a software interrupt to make this happen.

685. Emulator help! Please!

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-18 15:17:04 UTC
From: personable85 <personable85@hotmail.com>
Message-ID: <1176909424.286841.253420@n59g2000hsh.googlegroups.com>
Source record: 4720

Hello All,

I'm desperately trying to get North Atlantic Convoy Raider to work on my PC using an Atari emulator. Unfortunately, no matter what I do, I can't get it to work. I have no experience working with Atari computers, so I'm hoping that someone can tell me what I'm doing wrong.

1. I'm using Atari800Win
2. I downloaded the ROMs and loaded them into Atair800Win. The program accepted them so I
believe I did it right.
3. I downloaded North Atlantic Convoy Raider (tape version) (unzipped the file) from:
http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=3727
4. Ran Atari800Win. Screen displays: "Atari Computer - Memo Pad"
5. I choose FILE from the menu and then ATTACH TAPE. I then located North Atlantic Convoy
Raider from my computer directory and selected it.
6. I then select AUTOBOOT IMAGE from the file menu and chose the North Atlantic Convoy
Raider file again.

Unfortunately, the Atari screen goes blank except for the cursor and nothing else happens. What am I doing wrong? What do I need to do?

Any help would be greatly appreciated! Thanks!

Mark

After attaching the file, try Shift+F5 to reboot.

Hi,
This is from the help file for the emulator:
To boot the tape, hold Atari Start key (F4), while performing cold start
(Shift+F5). Then press Space key. Or just use File/Autoboot image (Alt+B).
but, depending on which version of the emulator you are using the start
key might be (F2)
```

Good luck a lot of the better games came on TAPE..

No success!
I tried both F4 & F2 while pressing Shift-F5 then Space. Nothing. A
return to the MEMO screen. Same with Alt+B. I'm thinking perhaps the
downloaded game file is bad?
Thanks!
Mark

You're busted. It doesn't work in atari800winplus.
It is a BASIC file, and a800wpl only seems to know
binary load cassette files. You can get the BASIC
file, (I have it), then just load a DOS disk with it on it
and do a normal LOAD "D:NAC.BAS".
This is somewhat problematic, because the BAS
file from Holmes has a really long name, you have
to rename it to a 8.3 format before writing it to a
disk image. Uhm.. Holmes has an .ATR of it,
so I guess that has the BAS on a bootable disk image
for you.
You have to have BASIC enabled, that's one thing.
Another thing is you are getting MEMO PAD, which
is emulating the 800, rather than 800XL.
If you like I can e-mail you a boot disk to use.

Worked ablsoutly fine for me Mark when I opend it and sent you the
listing. Make sure you have ATARIBAS.ROM as your Basic Rom, attach the
tape, press CLOAD at the ready prompt - press space bar - after a few
seconds it will be loaded - type Run

I couldn't get it work (the .cas file).
I tried a lot of things to get it to work. I ran the
BASIC file fine, from Holme's archive.
If you like sea war, you might like 'MIDWAY',
it is convenient in that it has doc on disk as well
as a program disk. It is mostly carrier action,
but will resolve surface action as well.
Then there's 'Warship' and 'Bismarc', which is
surface ship war, there's extensive documentation
for them, that might be hard to find. And 'Gato' for submarine warfare.
Gato was a 128k cart.

It works fine if you follow the instructions: just CLOAD the game and
RUN it, nothing complicated if you're used to the A8...

> then just load a DOS disk with it on it and do a normal LOAD "D:NAC.BAS".

You're making things more complicated than they are: you can either
use the virtual hard drive option or load your BASIC file as a tape
image (yes, it works).

I'm quite familiar with Atari 8-bits. And I tried
a simple File/Attach tape and give the NACR.CAS
I got from atarimania and re-named NACR.CAS. Uncheck 'disable BASIC' in the
Atari/Settings.
Then boot to READY, then CLOAD and get
error 138 (device not ready) or ERROR 21
(not load format).
Also, I have no disk in D1:.
If you see anything better, lemme know. It isn't
more complicated to get the BASIC file and put
it on an image and load it from READY prompt.
If there's a way to directly load a BASIC file from
at800wplus 3.1, I dunno.
Regards
in the Atari/preferences. Don't mess with SIO patch.

You can start by emailing the enemy with the wrong place to meet with an Atari. When he gets there, clock him over the forehead @ 1.79Mhz and then cut him up with an Atari 800 cartridge door heat sheild..

I don't know what you're doing wrong and why you want to rename the
file either... Again, works fine here with Atari800Win PLus 4.0, maybe
it's because you're still using the old 3.1.

Make sure your disk drive is turned off, load in 800XL / 130XE mode
(or you'll have to attach a BASIC cartridge) with SIO patch enabled.
The rest is the classic CLOAD / RUN operation.

> It isn't more complicated to get the BASIC file and put it on an image and load it from
READY prompt.

Come on, how is inserting a tape image, typing CLOAD and RUN
complicated? It's also pretty uncool of you to say that when people
like us as well as contributors have been working THOUSANDS of hours
to archive and preserve ORIGINAL software titles like this one.

Thank you everyone! I got it to work.

Apparently, I was in the MEMO screen when I needed to be in the BASIC screen (I didn't know there was a BASIC screen). Once I was in the BASIC screen, everything worked just fine. I attached the file. typed in CLOAD. Waited... Typed RUN and it worked. Simple as pie!

Thanks again for all your help! It is much appreciated!

Mark

Hardie har.
Thanks Frog and Mark. I still don't know what
my problem is, maybe 3.1. I found 3.1 to be less
likely to crash than 4.0.
Frog. I don't know what is uncool. But I'm old
enough to not be cool. The original poster got
what looking for, needed BASIC. Which I mentioned.
I'm not going to try 4.0, I've already tried it.
Heh, 1000s of hours. I'm sure I've spent many hours
doing Atari stuff also, including having a pretty good
archive.

Hi Guys,

Just thought I'd let you know that the Atari version of North Atlantic Convoy Raider (NACR) and the PET version are totally different. Why? I do not know. The Atari version is better as it has more features. Each version handles the play differently. Why Avalon HIll chose to do this baffles me.
Thanks again for all the help!

Mark

Source record: 4738

Hey guys,

We're all glad the original poster achieved success.

I played along myself. I don't consider myself a big emulator expert yet, but I've been using this one more and more. This was my first time trying to do something with a .cas image. But I'm also plenty familiar with the Atari (though probably less expert than Russ in many ways).

I found it pretty difficult to get this cassatte image running, though I finally did.

I'm using A800WinPLus 4.0 on Win98SE.

Playing with the same image:
http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=3727

Can we just load the .cas image the way we do with other types of images like ATR? That was what I first assumed, since I've looked at lots of ATR and executable files this way. But no, that didn't seem to work.

Can we use the Attach Tape Alt+T function to attach this tape image as suggested? For me, trying this crashes A800WinPL4. Hard. (Then, upon running the emulator again I made the mistake of agreeing to reset my prefs, which caused it to forget where my ROM files were, so I had to figure that out and set that up again.)

Ah, there's another way. Within the emulator, under the Atari menu, select Tape Recorder... This brings up the "Cassette Control" panel, where you can Browse for a cassette image. With BASIC up and running, I browsed and selected our raider.cas image. Then, finally the CLOAD function worked, and I was able to run the file.

My take: Yes, it works. Easy? It could be easier; it could be drag and drop.

And my consistent emulator crashes when I tried the Alt-T attach function with this image can't be the way the emulator is supposed to behave.

But now at least I've leared about the Cassette Control dialog box!

-Michael

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated).
An archive of c.s.a.a posts and the guidelines for posting to c.s.a.a:
http://www.atariarchives.org/csaa/ Moderator: Kevin Savetz

comp.sys.atari.programmer
Programming on the Atari computer.

I'm looking for a nice 1200 XL.

Any potential sellers? If so, please reply to this via "reply to author."

P.S. Due to postage, US/Canada, only, please.

Price depends on condition -- I'm quite willing to pay the going prices.

-Larry

713. R-Verter driver source code

Newsgroup: comp.sys.atari.8bit
Date: 2007-04-30 10:42:34 UTC
From: Matthias Reichl <usenet-200704@hias.horus.com>
Message-ID: <slrnf3bi0q.it.usenet-200704@camel.hias.horus.com>
Source record: 4748

Hi!

I'm looking for the R-Verter driver source code. Finding the object
files is no problem, but concerning the source I got as far as finding
out it was developed by S*P*A*C*E (Seattle & Puget Sound Atari Computer
Enthusiasts) and one should contact them to get the source.

Does anyone have the source or some contact information?

so long & thanks,

Hias

Perl Golfed:

DPO.82,9985:CLR:DIM N$(8),F$(19):N$="D8:DIRX3":CLS:? "DRV(1-8)":GET
D:F$="D :*.*":F$(2,2)=CHR$(D):CL.#1
OP.#1,6,0,F$:DO:IN. #1;F$:IF F$(1,1)<>" ":EXIT:ENDIF:?
F$(2,14);:LOOP:DPO.82,9986:GET D:E.N$

I also wonder why all the messing with the margins when you can just
use a REPEAT/UNTIL loop that'll also show the sector count?

Back in the day, Atari software in the UK was much more expensive than the US, it would not surprise me if the misleading information was simply down to Atari UK wanting to make more money.
Have a look at the Commodore book 'On the Edge' and see what they could get for a PET in the UK/Germany vs. the US, then remember these guys then took over Atari in 85!

717. New 7-year old SIO2PC version

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-02 14:52:28 UTC
From: kennnick@gmail.com
Message-ID: <1178117548.338429.152540@l77g2000hsb.googlegroups.com>
Source record: 4602

Hello Atari people. I recently got an email from a guy who wondered why I still have revision 4.19 of SIO2PC available on my site when I had issued revision 4.21 years ago (April, 2000 to be exact). I guess I just didn't realize I'd gotten behind. I dug through several computers and found the revision 4.21 source and executible and have now put them up.

It doesn't look like there were any big changes and no added features from 4.19 to 4.21 -- just minor tweaks. So if you use SIO2PC and it's working OK, you probably don't need to bother getting 4.21. I uploaded the "new" versions of both my distribution package and my source code.

Also, I've moved my web page a couple times in the past several years. The current location is

http://pages.suddenlink.net/wa5bdu/sio2pc.htm

Regards,

Nick
the SIO2PC guy

718. The ATARI 800 is crap!!!

It's time for Commodore and Sinclair users to finally
unite and bash the ATARI 800 computer, a real
piece of computer garbage.

The C64, the VC20, the Plus 4 are vastly superior to
the mediocre ATARI system and its mediocre games
that look worse than the average C64 type-in listing.

Even the Spectrum is far more powerful than the ATARI
and the Spectrum users finally need a system to bash
and the ATARI 800 is perfect to be bashed!

So, please, discuss the crapiness of the ATARI here:

The crapness of the Atari 800 is off topic for CSS, whereas the
crapness of the commode is entirely on-topic. If you're trying to
create a cross-group flame war, not enough people bought Atari 800s
for a flame war to really take off.

Don't point the finger in our direction.
We've never seen that moron before. (You can check for yourself via google
groups, I suspect he's one of yours)

I have a Atari 800 XE and I kinda like it. They keyboard is a bit
crappy, but most computers in those days had crappy keyboards.

A number of years ago they were on offer in a toystore chain. An Atari
800 with 10 games included and I bought one.

Then eBay arrived and I started looking for Atari 800 games. Funny
enough only those 10 games kept getting listed. So I guess a lot of
people bought this Atari 800 + 10 games set.

I think I actually have one in the loft somewhere, I've got at least two Atari 8-bitters and a few STs, I never owned the 8-bitters when I were a lad (I had a speccy) but I owned an ST -- for 6 months before realising it was shit compared to the Amiga and dumped it for half the price I bought it for! The amiga lasted 1 year before being dumped for an Acorn Archimedes, which was the best home computer *ever*, and one I used for 7 years before Linux came along.

Every computer company I've ever dumped has hit the buffers soon after I've jumped ship, see how the world follows my every whim ;-)

I had the same experience with my C64 when I bought an Amiga. I used my
C64 every day and thought I'd do so after getting my Amiga, but I didn't
and soon after they stopped producing it! Same for the Zzap! 64 mag., I
think they quit just after I stopped buying it.

Hell, we should go on the stock market with this kind of timing!

Yes, I agree. The C64 version of Rescue on Fractalus and Ballblazer are
superior to the Atari's smoother moving ones.

One thing the C64 has, it's sprites. The PM's on the Atari is good for some
stuff, but has it's limitations. And the C64 has one music piece that I
enjoyed, even though the SID chip is supposed to be so great, I really like
what for example Rob Hubbard did on Jet Set Willy, Warhawk, International
Karate. Excellent work.

Colors? Where's the shades on the C64? Hmmm. Vastly superior, okay.

I heard that's not the real Clive. The real Clive died when doing
audition for becomming the 6th Beattle. He was replaced by his evil twin
brother.

You might be thinking of Ian and Duncan Smith, the twins who entered
british politics. One of them managed to get to be leader of the
Conservative party, although it's not sure which one it was.

> Same could be said for God, Jezus and the Holy Poltergeist and look

Well, I saw a posting in a newsgroup saying that allah is the one true
god, it's getting a bit crowded in the heavens with all the one true
gods that are knocking about, but if it was in a newsgroup then it
must be true.

So, it's his evil twin brother who came up with the sinclair research range
of computers?

Not evil in my book then. Maybe the real clive was the evil twin and his
good twin took over.
:-p

Worse I'm afraid.
You missed the news... 2 of them are dead, one of them reads thomas the tank engine stories and the other one formed "wings" with his late wife linda (who couldn't hold a tune in a bucket) and hasn't been heard from much in the past few years.

That reminds me of an excellent reader cartoon published in one of the Speccy mags. Clive Sinclair was caught robbing banks, but they pulled off the mask la Scooby Do to reveal Alan Sugar, who angrily exclaimed "Blooters!".

I hope I didn't dream this.

Eq.

739. Thursday night IRC Atari chat 8 PM CST/CDT

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-03 17:59:58 UTC
From: JellE <jelle@door.net>
Message-ID: <1178215198.470735.285050@l77g2000hsb.googlegroups.com>

Hey everyone!!! We still have the IRC chat night going on each week,
on Thursdays, if anyone wants to come in and check it out. Official
gathering time is 8:00pm CST/CDT, and you have 3 options for getting
in:

- Use your favorite IRC client to connect to irc.newnet.net and join
channel #atari.

- Telnet from your 8-bit or other machine to irc.atarichat.net
(216.37.55.109) and login as "atari". This will get you into the chat
without the need for an actual IRC client.

- Use the Java applet found at http://www.newnet.net.

If you can't make it around 8:00 tonight, you can stop in at anytime,
somebody is usually awake. We are predominately 8-bit folks... but a
lot of us dabble in other stuff too. (Commodore, Amiga, STs, etc, etc,
etc) There isn't much we don't talk about. It is a lot of fun....and
very informative.

Hope you can come join us....we will be glad to see ya!!!

I always confuse the Smith twins, the Beatles and Sir Clive. They all do
look a like and all played a crucial part in the 1st Gulf War. Ehm, I
might be confusing them with the US army though, that happens too.

If there is a God or Gods, why didn't He/They destroy Atari (to get back
on topic)? It was Jack Tramiel with his son who had to pop over to
destroy the company from within.

743. UPDATE: New Telnet Information

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-03 21:55:52 UTC
From: JellE <jelle@door.net>
Message-ID: <1178229352.588032.140130@y80g2000hsf.googlegroups.com>
Source record: 4627
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

UPDATE: Telnet from your 8-bit or other machine to irc.atarichat.net (64.72.135.245) and login as "atari". No password is required...just hit enter. This will get you into the chat without the need for an actual IRC client.

The original post has the wrong IP... please make a note of this, otherwise you will not be able to get in. Thanks... and hope to see you there!

Well a troll as I live and breathe.

The 800 xl was actually quite a nice machine. The old 800 had those stupid
keys and thus was worse tan the dear old Speccy.

Its a big beast though.

The ATARI 400/800 Graphics Chipset started the race and ended it. Being
the all time First Place, except some nineties MSX trash, ten years to
late :)

> Even the Spectrum is far more powerful than the ATARI

It is, in various cases...

huh? Why should I bash an ATARI? That should remain to anyone self,
having an ATARI :)

> So, please, discuss the crapiness of the ATARI here:

I hardly imagine a crap going with the 8bit ATARI... maybe the Price.

Atari is broader. Faster.

IK sounded better (MUCH) on the Atari. IK+ Sound on the C64 improved
vastly, but missed the charme (slow, swaying forward backward sound) of
the former IK on ATARI Pokey. Faster and more hectic.
Like any Game on C-64.... The Sound was/is somehow alone and mainly out
of timing to that what's happenening on the screen :)

Although, a cross check to the AMIGA IK+ Version auds you, how a real
synthesizer sounds. The Paula Chip is by Miles away better... anyway.
Filter ON, of course!

Better a Sinclair Spectrum 128K and a TB-303. Then you can wild the
knobs, for a slightly better sound than the SID already had.

> Colors? Where's the shades on the C64? Hmmm. Vastly superior, okay.

Give the ATARI GfX Chipset a try ;-)

What's that? Chipset for PC? I guess you are not talking about ANTIC, are you? I programmed the ANTIC and love it. Atari's have the most charming chips I think. My first love was the Atari 800. More fun than I had with my later wife

I suggest B&C Computervisions.
www.myatari.com

There's also Video 61 and Ben Smith are active.
For a comprehensive list of vendors, what they sell, where they're at, you might see the vendor list,
which is in the 'Welcome to Comp.sys.atari.8bit FAQ', here in this newsgroup.
And then there's ebaY.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

Ever hear of the Atari Drop Test? I was running my BBS in local mode
at an Atari Show -- while the program was running lifted the 800 six
to nine inches off the table and let it drop. I will admit that the
program did stop and I had to type "goto main" at the prompt.

We had several DOSs -- Atari DOS 1 and 2 and 3, SpartaDOS, SmartDOS,
MyDOS, others.... I made a floppy disk that you could toggle (by
overwritting the boot sectors) to boot up in four or five different
DOSs.

But what I liked best about the Atari was the BASIC. All of the other
computers had to compile their programs to be able to run a BBS. The
Atari could run a BBS aat 1200 baud in plain old BASIC. You could
stop the program, modify it, and just continue. Which is why the
Atari, with about a tenth of the computer market, ran about half of
the BBSs early to mid '80's. In 1986 I had the world's fastest 8-bit
BBS -- running in interperted BASIC.

Hmm, that Atari "drop" test sure did change by the time it got to the ST
line.

There, if the computer *wasn't* working, you would pick it up 6-12 inches
and let it drop. More than likely, the computer would start working again.
(chip creep). Atari Corps own techs would recommend this procedure over
the phone.

Gotta love it. :)

Yes, less colors on C64 but the benefit of that is that the
C64 can use the colors much more efficiently. On A8, you're
bound to 4 colors on 160x200 resolution.

Did you ever see the 256 colors pictures on the Atari? They look better than any I've seen on C64. Granted, the resolution is even lower there, but still they look damn fantastic for an old computer.

And again, for speed, try out Rescue on Fractalus and Ballblazer on both consoles, Atari beats it hands down.

BTW : I do have C64's too, so I am not Atari all the way, but I love Atari more than any other computers. Guess the Star Raiders thingy got me and kept me

Then you should seriously watch more C64 graphics, there is tons
of awesome 160x200 or 320x200 pictures out where I have never seen
anything on A8 which comes even close to it.

> Granted, the resolution is even lower there, but still they look damn
> fantastic for an old computer.

It looks nice, but is also flawed (low resolution and only every
2nd rasterline contains graphics)

> And again, for speed, try out Rescue on Fractalus and Ballblazer on both
> consoles, Atari beats it hands down.

I never argued this. (Although I think that Ballblazer C64 could've been
atleast equal to the A8 version, but that's another matter...)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy

774. Atari 400 keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-15 11:13:25 UTC
From: Bill H <bill@ts1000.us>
Message-ID: <1179227605.581676.261750@n59g2000hsh.googlegroups.com>
Source record: 4559

I am considering making a new mebrane keyboard for a different
computer (TS1000) and wonder how did Atari handle the space bar on
the
400? Is there multiple contacts or is there a long contact?

On a standard size key you can have a single contact in the center
and
it would work, but how about the space bar? Is there a "sweet spot"
on
the space bar where it works and on another where it doesnt?

Bill H

775. A DarkForce! BBS update (May 2007)

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-16 18:51:16 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <pan.2007.05.16.18.51.16.599483@suddenlink.net>
Source record: 4560

First, apologies for being late this month, many, many
many things going on. An Atari SysOp is never bored. :)

Second, we've reached another milestone (of sorts) here,
at The DarkForce! BBS. We just recently added our 500th
user!

Because of that, I had to expand our user database. Some
functions, such as MassMail will have some unintended
consequences because of this. Current users will have
multiple old MassMail entries waiting for them. Simply
hit any key to go through them all. Everything should be
returned to normal on your next call. Thanks for your
patience and understanding in this matter.

So...here is to another 15 years and 500 more users! :)

Our monthly winner of the 3 magazine subscription to
ST Magazine is:

Orion_

Congratulations, and remember, you can't win if you don't
call each month! :D

I thought I knew of all game titles made by the big
game companies for the Atari, but apparently I was
wrong.

I had never heard of "Morloc's Tower" and "Plattermania"
before.

Okay guys... as some of you may already know... Telnet is down. It
should be back up in a couple of days. But in the meantime... the java
applet is still available at www.newnet.net... although, some people
seem to be having problems with it. The best bet is use an IRC client.
I did discover a problem. Most of the servers won't let you in unless
you use port number 6667. So... if you are having problems connecting
to a NewNet server here is my suggestion. Type /server servername:6667
(ie: /server irc.eyearesee.org:6667)

Here is a list of the servers on New Net

irc.tobug.net
irc.Sith-Net.com
irc.rejectauthority.com
irc.redwolfs.net
irc.ircsoulz.org
irc.frog-face.com
irc.eyearesee.org
irc.spasticsystems.co.uk
irc.flatlined.net
irc.indianskickass.info

Hi,

I miss the day of a monthly meeting to talk computers. I was
wondering if anyone in the Charleston,SC,USA area would like to start
another one? I don't know many people any more that use the C64, or
anyother 8 bit, but I might get lucky.

Thanks

Source record: 4571

Hi guys. Just wanted to do a little self-promo -- I've started making flash drives stealthed inside Atari cartridges! Figured this was the best newsgroup to announce it. The first one was handmade (next time I'll use a Dremel; X-acto knife cutting isn't too easy!), and includes the original label (with the usual wear and tear).

The very first auction: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=260119451113

Once I get a little more money I plan to use reproduction laser-printed labels, and offer 1, 2, and 4GB drives. Let me know what you think!

787. IBM drive read Atari Disk

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-19 03:18:01 UTC

Actually some can read single density. The first true IBMs had disk
conrollers that would switch to FM, it was later stuff that was spotty.
I've even had late model VIA or IDT all in one chips do it.

IMO you would probably be better off trying single density format to
recover/transfer anything since the density and a half 26 sector per
track format was a tough read even for MFM controllers.

Easy way to test your system is with 2 programs and maybe an emulator.
Get ANADISK which is a generic CPM/??? reader and DEANA which inverts
the bits you get out of ANADISK to Atari format. I think the disks can
just be given the .XFD extention and read into any emulator that
supports that format.

Here is what we need to do... you see, we as Atarians need to set up a virtual meeting room.

Make it where we can all log in, and walk around this meeting room (I picture kinda a Quake III or better engine) and everyone like in Quake can walk around from table to table. Once they get to a table, they can view the live stream of a computer setup that a user has under a camera. That way it looks like a computer on a table in a meeting room and that user can demo something and people can still look over his shoulder.

You can set it up so that all the demos kinda stream the sound all at once so that you get the noisy effect of a meeting, or where you can only hear what is a certain radius from what is around your character.

You can walk up to people and talk (audio chat) from person to person. Ect.

If I had my drethers, I would go to the Dallas Infomart and map that place out and use the Infomart as a base for a meeting area for all user groups.

This way many retro fans from all around the world can finally be at one place.

You can even mark off a "Photon" area where weapons can be pulled out and you battle each other. :D (If it is already a modified gaming engine, not to far a stretch. Everywhere would be a safe zone except the "photon" area.) (Photon was early laser tag here in Dallas).

Now... say someone wants to try a demo. What could happen is, the characters could exchange seats, and the camera could switch from one users' computer to another user's computer, but just display the same game. In the meeting room, one person would get up from in front of the computer and the other would sit down and play. :)

Basically the IRC chat to meet is already an ongoing meeting room, now to add some graphical settings and streaming video and I think we'd be set!

At least till transporters can be invented.

Cool! :) It's amazing what you can use 2600 carts for.

Me, I would probably put a USB drive in a 400/800 cart, just because I'm an
atari 800 nut!

> the Enhanced Density disk???

As Rick already wrote, some can and some can't. There are even some
controllers that can write Enhanced Density but aren't able to read
back what they just wrote.

Have a look at WriteAtr, the latest version supports reading/writing
enhanced density and there's also a lot of background in the readme:

http://www.horus.com/~hias/atari/

Unfortunately most PC disk controllers have problems reading disks
formatted on the Atari 1050, mainly because the the 1050 didn't
care about the index hole and the PC disk controller just aborts
reading a sector if it encounters an index pulse. So you'll have
a single bad sector in each track...

You could try disabling the index pulse on the PC, for example by
covering the index hole on the disk. I haven't tried this yet,
some drives/controllers could go nuts, with some it might work.

so long,

Hias

I do not know if any specific drivers for the LJ5 etc were made. I have a driver for Paperclip for my HP DJ500P. The problem is that with PCL, a single command can be 4 to 10 characters long. Sometimes, they can be stored in a macro that can be called using fewer.

Barring a mod of the software, the only option is to embed the commands in a document(which I still had to do with paperclip sometimes), or create print files to send to the printer as needed.

Hi Russ,

Advanced Search: Click on 8-Bit (left), then click on Advanced Search at
the top.

There are common titles listed as rare, but they're actually rare versions
of common titles.

I have no idea how the 1-10 rarity ratings are derived. But maybe that's
described somewhere on the web site as well.

There are 3 carts with rarity rating of 1: Centipede, Pac-Man, and Star
Raiders. That actually seems about right. :)

Oh, and I see it matters which software category you're in on the left.
Within Utilities, the only cart with a rarity rating of 1 is BASIC. Also
as expected!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated).
An archive of c.s.a.a posts and the guidelines for posting to c.s.a.a:
http://www.atariarchives.org/csaa/ Moderator: Kevin Savetz

comp.sys.atari.programmer
Programming on the Atari computer.

> Kinda. Star Raiders was so awesome and it happened again the first time I
> played Behind Jaggi Lines (to be re-named Rescue on Fractalus)

Yeh those look so basic now, but they were mind blowing then.

I remember Rescue on Fractalus and how you could fly into the atmosphere, the landscape detail, landing... having that creature pound on the wind shield always scared the hell out of me. Just a great great game.

Star Raiders for gameplay still does the trick. :)

810. Atari Trash

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-28 21:23:37 UTC
From: firstname@lastname.net
Message-ID: <465b4390.1115921234@news.la.sbcglobal.net>
Source record: 4595

Let's see.... I has a pile of junk, a pair of Atari 800's, and 800 XL, a 1200 XL, and a 130 XE. (the 800 XL I could manage to get working to the TV set.) A 'new' keyboard for the 800 XL, A tape drive, a 820 disk drive, a 1050 disk drive, five RANA drives in various stages of decomposition, altho' one of them actually managed to boot a DOS disk! Not bad for 20+ year old disks and drives. A pair of 850 interfaces, an ICD MIO (Multi I/O) interface with 256K RAM, serial, parallel, and SCSI/SASI interface (I had used this to run my BBS on an 80 Meg HD) a Volksmodem (with cables!) a pair of Atari 830 accoustic modems (one boxed), an Atari 1030 modem, a boxed pair of Atari Wireless remote joysticks, a Koala Pad with a Koalapainter cartridge, and a pitiful assortment of cartridges, including a pair of BASIC-XL carts. Everything looks like it has been moldering in the garage for a couple of decades -- which it was.

$20 for delivery within 10 miles of Gardena, CA -- which could be a business establishment you have called to arrange packing and shipping from. Offer expires at 4pm on June 1st when it goes to the dump.

I need a spare SIO cable for SIO2PC. Is it possible to buy these
anywhere or anyone have a spare they'd be willing to sell?

I'm hoping to use SIO2PC to finally get my first programs off the
disks where they've been mouldering for 20 years and properly archived.

The best I can do is stop by the FedEx/Kinko's in Hawthorne, (310)
297-6850. You can give them your credit card info and pay for the
packing and shipping yourself, plus the $20 for me. If I am to do the
work my rate is $120/hour, $500 payable in advance & I'll refund any
excess over my labor and costs. Personally I don't think it is worth
shipping as we're talking well over 50 pounds.

Or you can try finding a friend/neighbor with relatives/friends here
in the SouthBay for me to take it to and have them do the work.

818. Atari Panther sounded like a rediculasly powerful 2D machine.

Newsgroup: comp.sys.atari.8bit
Date: 2007-05-29 18:02:41 UTC
From: Sprite Scaler <spritescaler@directvinternet.com>
Message-ID: <1180461761.513742.119870@w5g2000hsg.googlegroups.com>
Source record: 4503
Cross-posted to: alt.atari-jaguar,alt.atari-jaguar.discussion,rec.games.video.atari,comp.sys.atari.8bit,rec.games.video.classic

Panther could
-display 8,192 colors on-screen from a palette of 262,144 colors.
-handle 65,535 sprites of any size simultaneously.

Martin Brennan (one of the engineers who formerly worked for Sinclair
research, started Flare technology who made the Flare One chipset,
merged the Flare One chips into the Slipstream ASIC with improvements
for the Konix Multisystem). had this to say about Panther:

"It was a novel video architecture that allowed you to create windows
of different sizes and different bit depths. Essentially you didn't
have a frame store - it was a composite of frame stores - a kind of
smart video frame store. It would have allowed a great deal of sprite
style animation. Sprites in general in those days would have been of a
fixed size e.g. 16x16. The games looked 'spritey' because of that,
this would have been quite an interesting departure."

http://www.konixmultisystem.co.uk/testing/index.php?id=interviews&content=martin#start

if Panther was as powerful in 2D as claimed, it would've been
incredible in 1991-1992, with more sprite pushing power than SNK's 16-
bit NEO-GEO
(4096 colors from a palette of 65,536 - 360 sprites)

I wish Atari had released Panther with in 1991 with ports of sprite-
based arcade games that were impossible or difficult to pull off on
NEC PC-Engine, SEGA Genesis, SNES, SegaCD, etc.

Well, if the Panther could "not suck" then it could definitely do at least
one thing the Jag couldn't.

(for those who can't read between the lines, the Jag {for the most part}
sucked)

As I understand it, the Jaguar was essentially a Panther with a larger color palette and rudimentary 3D, as well as the larger bus. It has often been commented that the Jaguar (as wel las the Saturn) had very powerful 2D hardware. Problem is, developers were very quickly moving away from 2D games at the time.

As for whether or not the Jaguar sucked - I still think it was pretty great, but it was clearly held back by a lack of quality software (something Atari only made worse) and some significant design flaws (bugs in the custom chips, buffers too small, etc).

the two things that set the jaguar back was that it was a powerful
machine that very few understood how to program for it.
that is why there are those "16 bit" looking games on the platform.
the other was the tremeils.
i have a panther, i bought it out of the atari offices. but alas, no
software.
thanks,

Speaking of Summer Games, that was a fun game! My siblings and I spent
countless hours playing that. Ah, the memories... :)

I could seriously spend at least a couple of days doing nothing but
playing Atari games with my kids. Maybe I will - I just need to dig
out and hook up enough systems that all 4 of them (and me, of course!)
can play at the same time so that there is no fighting. Maybe my wife
would even join us. :)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated).
An archive of c.s.a.a posts and the guidelines for posting to c.s.a.a:
http://www.atariarchives.org/csaa/ Moderator: Kevin Savetz

comp.sys.atari.programmer
Programming on the Atari computer.

842. Vintage Computer Festival East 4.0, this weekend!

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-05 05:07:52 UTC
From: evan947@gmail.com
Message-ID: <1181020072.965060.220100@h2g2000hsg.googlegroups.com>
Source record: 4527

For immediate release:

MARCH, VintageTech, and the InfoAge Science Center announce the
Vintage Computer Festival East 4.0

What: A celebration of computers, technology, and culture from the
1940s - 1980s. Open to the public
When: June 9-10. Lectures from 10am-2pm, exhibits from 2pm-6pm both
days
Where: InfoAge Science Center, 2201 Marconi Rd., Wall Township, N.J.,
07719
Cost: $10 for one day, $15 for two days, free for 12 and younger, free
parking
Contact: Evan Koblentz, evank@midatlanticretro.org, 646-546-9999
------------ --------- --------- --------- --------- ---------
--------- --------- --------- --------- --------- --------- --------

Do 8 bits excite you more than 64? Prefer blinkenlights over SVGA?
Yearn for the days of input via toggle switches and paper tape? Or
just want to play some Pac-Man? Then check out the Vintage Computer
Festival East 4.0, June 9-10, at the InfoAge Science Center in Wall,
New Jersey. This year's event is again hosted by MARCH -- the Mid-
Atlantic Retro Computing Hobbyists.

The Vintage Computer Festival began in 1997 in Silicon Valley,
migrated eastward in 2001, and became a MARCH event in 2006. So what
is a VCF? Imagine an antique car show where every owner let you test-
drive his car, and where Henry Ford gave a lecture and signed
autographs! It sounds unreal, but that's what happens with vintage
computer technology at every edition of the VCF.

This year's edition of the VCF East will feature 20 exhibits of
computer technology from the 1940s to 1980s. Visitors will have the
opportunity to use an IBM punch-card machine, witness a legendary
Digital Equipment Corp. PDP-8 minicomputer in action, and experience
all the top brands of 1970s microcomputers from companies like Apple,
Commodore, and many others. Older S-100 kit computers, single-board
computers, portables, and even analog and prehistoric computer
technology will be demonstrated. On the extremes, we have one
exhibitor preparing to show an authentic NASA Apollo flight computer,
and another who'll display the most classic videogame console ever --
Atari -- play it 'til you drop! Read the full exhibitor list at
http://www.vintage.org/2007/east/exhibit.php.

If that's not enough, then listen to some of our guest speakers. The
highlight this year will be a 30th anniversary panel in honor of

Commodore, which was headquartered nearby in West Chester, Pennsylvania. The panel's star is Chuck Peddle, inventor of the famous MOS Technology 6502 chip, used in a wide variety of classic single-board computers and in microcomputers such as the Commodore PET and the Apple II. Peddle will join us via live videoconference, in which he promises to share previously untold stories, after which he'll answer audience questions. Commodore engineers appearing live at our show will include Bil Herd, Bob Russell, and Dave Haynie. We'll even have a birthday cake featuring the famous Commodore "Chickenhead" logo. Other speakers this year include Herb "Dr. S-100" Johnson, who'll explain the history of the CP/M operating system; Bill Degnan and Sellam Ismail; who together will give a crash-course in vintage computer discovery and restoration; and others to be announced. In addition, Ismail will give a second talk, but the topic is secret! You'll have to be there to find out what he plans.

Yet another highlight of the VCF East 4.0 will be our new VCF Theatre, organized by acclaimed technology filmmaker Jason Scott. His films include "BBS: The Documentary" and the upcoming "Get Lamp" about text-adventure games. At the VCF Theatre, he'll be screening vintage computer-themed movies all weekend long in the afternoons.

New this year is the donate-to-sell booth. Here, everyone is welcome to donate vintage computing items, with all proceeds to help MARCH build its computer museum. Our museum directly benefits future generations, so do your part and give something to this wonderful non-profit cause! (We request that any unsold items be re-claimed before you leave the VCF.)

Did we mention the prizes? We'll have t-shirts, vintage computer replica kits, books, and maybe a surprise or two. All you have to do to win is show up, and be there when we announce winners each day.

Finally, should your historic technology interest extend beyond just computers, then you've come to the right place. Our venue at the InfoAge Science Center is historic in itself. The facility began life in 1912 as an R&D center for Britain's Marconi Wireless Telegraph Co., and then spent several decades as Camp Evans, a top-secret laboratory of the U.S. military. RADAR that first spotted airplanes over Pearl Harbor and mankind's first radio signal to the moon were invented here, along with numerous other achievements. Today, the center is on the National Register of Historic Places and is a Black History Site. It's also home to the National Broadcasters Hall of Fame and an assortment of non-profit clubs all related to the history of technology, with a local focus.

Driving directions, lodging information, exhibit details and more are posted at www.vintage.org/2007/east/.

For more information about MARCH, visit www.midatlanticretro.org
For more information about the InfoAge Science Center, visit www.infoage.org
For more information about VintageTech, visit www.vintagetech.com

General questions? Want to exhibit or have a vendor booth at the VCF East? Member of the media? Contact VCF East producer and MARCH president Evan Koblentz, evank@midatlanticretro.org, 646-546-9999.

843. Omnimon XL connection schematic?

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-05 07:35:04 UTC
From: Dropcheck <dropcheck@yahoo.com>
Message-ID: <s74a63pdmscvvpej8rju5vfes0ea7es8nd@4ax.com>
Source record: 4528

Hi,

Was hoping someone could point me in the right direction. I have
a 130XE with an Omnimon XL installed. Some of the wires have come
loose. I was wondering if there is a install manual/schematic or if
some kind soul has a set of good quaility photos of thier 130xe
installation. It would sure help me salvage this computer.

Thanks,

844. Re: Omnimon XL connection schematic?

When you say Omnimon, do you mean the Ramrod 3-OS board, or just the
Omnimon OS chip?

The Omnimon was just a ROM chip that replaced the XL OS ROM.

The Ramroad board pluged into the OS socket and then had a wire going to a 3
position toggle switch to allow you to select which of the 3 OS's to use.

There are no other wires than that one

I have on of these in my 130XE (and the original docs) and can take a photo
for you.

-Jason

Hi,

Thanks for your quick response. I'm not sure what I have is
either. I have put up on a scractch website these photos. I was told
this was the Omnimon XL upgrade. But it definitely has more than
three wires connected on the board. Could it include the Ramrod XL
upgrade too? Let me know what you think it is.

Ok, you definately have a Ramrod board in your 130XE.

It is fully populated with 3 operating systems:
Omnimon
Omniview (80 column OS)
Standard XL/XE OS

The grey cable with the 3 position toggle switch is the only one that is part of the Ramrod board. The switch connected to it allows you to select which of the 3 OSs you want to use.

I have no idea what the other red wires and the other switch do. Probably someone else in this group would know. One strange item is that it appears that one of the 64K RAM banks has been removed. I see what look like sockets installed there but no RAM chips in them.

-Jason

847. Tons of H/W S/W peripherals docs

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-06 02:54:24 UTC
From: s.torpe@sbcglobal.net
Message-ID: <1181098464.856542.230660@q66g2000hsg.googlegroups.com>
Source record: 4532

I have an ATARI 800XL, several 400's with at least one modded with
more memory, disc drive, printer, interface module, tape drive, tons
of cartridges and disks, remote control joysticks and other
controllers, and dedicated color monitor. Factory operating system
docs, manuals, Antic mag's, etc....don't even know how much, but
several large boxes.
Need to find good home with Atari fan, no reasonable offer refused,
but gotta take it all. Got something to trade? Would be free but
don't
want someone to grab it on speculation for a garage sale. This is
classic early personal computer history, deserves to live on.
Will be taking to the Midwest Gaming Classic this Saturday, but no
booth or table, so contact me by email.
I am in Crystal Lake IL if you are nearby. Will not ship unless you
pre-pay cost - lots of stuff and heavy.

Regards,

------------------------------

Subject: Introduction

Conventions
-----------
```

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member

countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

I concur with Jason on the added triple OS mod but can also add that someone is in the middle of a extended ram upgrade on this machine as well. I can see pins 11, 15 and 16 lifted on your PIA which are PortB's bit 1, bit 5 and bit 6 respectively so that's an extended memory mod to be sure. Plus you are missing the ramdisk memory chips probably to be replaced by 256k chips or ??? I don't know right off which memory upgrade this might be or if it's wired right to begin with. Sadly, my guess is it's a botched job considering it never got

finished.

I can see one stacked glue logic chip to be a 74LS32 but what is the other one? And where are the loose wires? Perhaps just from a description of the connected end, someone could figure out where it's supposed to go.

Hi Jason,

This was a ebay purchase a couple days ago. I should be getting my
hands on it Thursday.

Seems like some wires go through a ground hole to the other side.
I've got some time this weekend to investigate further. Still might
need a pic of your setup. I'll let you know what I find out.

Hi,

I see the second bank of memory missing now. Jeeze, not sure why
I didn't see it before. Quick question. Is the second bank socketed
normally so that the motherboard can be used as either a 65XE or fully
populated as a 130XE?

According to Lee this could be a botched memory upgrade. Now the
extra wires are starting to make sense. Still doesn't explain why
the extra switch though..

Later,

That switch may control Basic if the memory mod is large enough to
need all of PortB for memory bank management... just a thought.

Yeah.
And Summer Games is available on cartridge also. Alas, while the disk version of SG is for 8 players (with an option to save world-records on disk), the cart version is only for 3 players (no saves possible)... but therefore the cart "loads" much faster, no more disk-flips, etc. ! Check Video 61, B & C Computervisions and other vendors for the cart version... greetings, Andreas Koch (aka Andreas Magenheimer, now married!)

And Jess could be right as well concerning the purpose of the second switch. OTOH, some updates have this incredible approach of adding in an "off" switch so the user can run it without the upgrade. Such a switch should give the user back his original setup which I find to be mission impossible in general so I have to wonder about the intelligence of including a switch to begin with but some still do.

Only way to know what that switch really does is to know where the wires go and only you can do that once you get your hands on it.

Answer to second question is no. There normally are NO sockets on the 65XE or 130XE - NONE!! Since you've even got a 40 pin one (PIA), there has been a lot of unsoldering and resoldering done to it. The motherboard of the 130XE is one of the most un-forgiving boards that could ever exist as far as soldering accidents go. Lifted traces, cooked substrate now becoming a conductor and thus ruining the board permanent like are always a possible outcome with every touch of the soldering iron. Just more reasons to strongly assume it's a botched job, but don't give up on it yet. IIRC, the 65XE just has the missing ram chips with the solder holes filled with solder, but I don't actually have one to verify that with so I could be all wet once again.

Hello everyone,

Thanks for the posts. I got the 130XE today. Opened it up and
confirmed my worst fears. This is definitely a badly botched memory
upgrade. Missing the second bank of memory as well. The only thing
that might be salvagable is the Omnimon board. Even the XE OS chip
had bent pins where someone had jammed the chip into the socket.

Is there anything special I need to do to test it on an 800XL? I
believe I have one with a socketed OS chip.

Thanks again everyone,

Later

The Ramrod board just plugs into the existing OS ROM socket (or is soldered into it's position). If it is socketed, then all you need to do is pull it out and plug it into the ROM socket on the 800XL.

It would be rare for it to be socketed on the 130XE though, since there wasn't enough clearance to have it fit under the keyboard if a socket was in place. On mine, even soldering it directly to the motherboard, I had to cut a hole in the RF shield to make it fit. If this is the case, you can pull the individual OS ROMS and swap one of those with the OS ROM in the 800XL, but you lose the ability to change the OS via the toggle switch.

-Jason

I just thought I'd let you know what I've been reading into the "Crusader" spam. I don't want to post this to usenet because somebody might try to tie that in to my posts in some way (someone already has, in uk.misc).

First of all, I'd like to ask you to believe that my phone line in my apartment is bugged, and has been for many months. I have moved a couple of times this year, but "they" have faithfully been on my trail.

Anyway, let's suppose my phone line is bugged. Now, when I talk to my internet service provider, it's over a SLIP (now PPP) connection. So if you wanted to bug what was said, either you'd listen in over the line and have to decode the transmission, or you could go to the service provider (more difficult) and ask them to decode a particular user's connection.

OK, so now they're listening to everything I do over my SLIP/PPP connection. A couple of months ago I was messing around with faking articles through nntp servers and through anonymous remailers. I chose a nice inconspicuous newsgroup for my little tests, something no-one would ever notice. Guess which newsgroup I chose??? Yes, _FISH_!!! or rec.aquaria to be precise

And guess what articles I tried to post? Goldfish, Koi carp and, you'll never guess... PIRANHA!!! The goldfish article and the Koi went through, but the piranha didn';t appear.

by now you probably think this is too silly for words. But if you look in the papers a few eeks ago you will find John Major, Tonny Blair and Paddy Ashdown sharing a "private joke" about Major's sunburnt goldfish. We haven't had anything about Koi yet (they must be too dull). Now, sent by someone who clearly knew what they were doing (they chose an Italian backbone site for their launch point) we have many thousands of messages to people all over the globe. All about piranha, and with the punchline "that gives you something to think about, doesn't it?"

The way it works is that they're trying to kill two birds with one stone again. I don't knoiw why they should be against these national alliance people, but my interpretation is that they simultaneously try to discredit them, and stem the flow of Corley articles.

>corley" is. But at least we're observing a studied silence for now.

:People can always be called "MR X", to save them being named.
:
:I'm completely perplexed as to what you mean by b). Revealing identity?
:To who? And why would this be bad for any part of your life when you
:already have a less than respectful reputation here?

I'll just enumerate one or two things that I can still remember. Sometime
around August/Sept 1992 I was living in a house in Oxford, and coming out
of the house was physically attacked by someone - not punched, just grabbed
by the coat, with some verbals thrown in for good measure. That was something
the people at work shouldn't have known about... but soon after a couple of
people were talking right in front of me about, "yeah, I heard he was
attacked".

Again, one I went for a walk in some woods outside Oxford. The next day,
at work, someone said "you know he went to the forest yesterday".

I don't want to put details on usenet of what happened because to do so
would be to risk it happening again. If you put ideas in peoples' heads
then you can find them reflecting back at you, and I don't want that.
Also I can't remember that much from three years ago. From november 1992
I started taking "major tranquilizers" and just blotted the whole thing
from my mind.

>This is a feature time and time again, that the security services
>(presumed) get at you by manipulating other people around you to get at
>you. If you have their contacts, manpower, resources and technology then
>you can do that sort of thing.

:But why? Are you a threat?

They pretend they "have" to get at me. After the first few weeks they had
to find a reason to spy and abuse. You can't abuse someone unless they're
in the wrong in some way. What I did "wrong" was to be ill. So it became
"nutter" and "monster" and "he's going to attack us" coupled with
"ha ha ha, he can't do anything to defend himself, it was so funny". That
obvious contradiction within their propaganda is something they
blithely ignore.

:So, the Security Services never *actually* appear, and you assume that
:they get someone else to do your dirty work. This is a bit of a big
:logical step, here: That person doesn't like me, or is causing me trouble,
:it's not because they've got problems themselves, it must be the "Security
:Services". Yes. Because people are infallible. Or is there more?

A single source is indicated because of the range of harassment.
BBC + Capital + manipulated_public_at_large + set_up_situations,
what does that add up to? Add in the technology to carry out the
covert spying and the manpower and knowhow to follow you around for
five years without being spotted. It smells very much of the security
services, because there is no other organization (to my knowledge)
which does the things I've seen these people do.

Remember, they have deliberately chosen the softest of soft targets
to victimize. They purposely chose a mentally ill person who they thought
would be likely to kill himself anyway, so that they could get away with
murder.

And in all likelihood it will have started as a personal vendetta by someone.
Who could that be? I don't know, but I can give you some clues.

The first possibility (deep breath) is that someone from my college set me
up. Six years ago I graduated from university in the UK, during the last
year there I was steadily getting more and more ill. I know that I was
talking in my sleep; although I don't know what I was saying, it got
me a reputation, and if someone from my college talked afterwards to
the "wrong" people then that could be the reason for all that has followed.

I think that's the strongest contender for source. Directly beneath my
room lived another bloke who frequently had his friends round late at
night, after the time that I went to sleep. So they could have heard what
I was saying in my sleep, and that could have got me the reputation for
"talking to myself".

What I don't know is why that should have rebounded a year after I left.
You'd think it would have happened sooner; it's a bit odd to wait for a
year and then start abuse. That leads me to question what in particular
happened around May/June 1990 for them to start then.

>What I don't know is how it looks from the other side, from the side of
>the people who are being manipulated to get at me. On a couple of
>occasions I have challenged people to tell the truth of the matter, but
>they have alwats ducked the challenge.

:Have you ever considered the possibility, that you have made a mistake, and
:the people don't know what you are talking about?

Yes. I am currently considering the possibility that some people around me
know only what is being posted on Usenet, and have not been "contacted"
by "them". But I _know_ that others have been contacted.

:What words? Are they in common use? Could they be a catchphrase of a
:popular comedian?: "Nice to see you, to see you nice"?

In England the all-time No. 1 is "nutter". Easter this year, returning home from Clapham police station to report five years of harassment ("we're not saying it's happening and we're not saying it isn't happening"), another "not happening" incident of harassment when a cowardly little slut did her country proud by yelling "nutter, nutter, nutter" in the face of the hated enemy.

What can you do about that? You can't yell abuse back in their face, because they know they're supported by their peers, by the media, by the murderers in the security forces. You can't put them down when the fascist establishment is on their side. You can't hit them, because they would deny their abuse, they would deny knowing anything, and bring charges against the "nutter" who attacked them "at random".

>You know, you're
>passing saomeone, they're hardly going to construct an argument for your
>benefit, so they work a word of abuse into the conversation which they
>can giggle at.

:Abuse such as what? We're all adults here, we can take it. Is this abuse
:aimed at you? How can you tell it is?

I think I've said already what the words are. Thing is, at any given time the language is consistent. In January everyone's calling you X, then a few weeks later people stop calling you X and start calling you Y.

You can tell it's aimed at me, because when people repeatedly say the same words are you walk past, then laugh, you would have to be hard of understanding not to recognize it.

>Or they repeat something that's been said somewhere else... the PE thing
>being a case in point. PE says it, then other people pick up the refrain.

:Remind me who PE is again.

PE = "Private Eye"

>: >To give you an example, which I mentioned in another posting. In around
>: >October 1992, Private Eye ran a cover with the heading "Major's support
>: >lowest ever", with John calling to Norma on the cover "come back, Norma".
>: >Only one obvious interpretation to that, isn';;t there? I certainly
>: >thought so when I saw that cover. Wrongo!! Down the pub with people from work
>: >Simon says to phil, "don';t you think it's wrong then?" phil says, "well
>: >private eye are usuallyright"..."hislop strikes again..
>
>: Erm. Mike? Heeeellllllooo? What are you on about. What is the other
>: interpretation then? Norma having an affair? Seems a bit wrong, with the
>: heading "Majors support Lowest ever"...
>
>No, this one isn't obvious , it really does need to be explained. I
>certainly didn't understand it when I first saw it. You see, the kernel
>of vitriol is in the words "come back". At the time, the themes of
>abuse were centred around interpretations of those two words (stretch your
>mind a little bit, I don't have to spell it out for you, surely).

:You did in your mail item.
:
:You seem to be scouting about something called a "Double Entendre". The
:inference being "Come" = Ejaculation, "Back" = Anus (not the first part
:of the body I would have went for, I would have foolishly gone for "Back",
:silly old me).
:
:You see to have picked a sodomy double entendre out of a Private Eye
:headline. They are everywhere. The English language has much double
:meaning in it, and if you put your mind to it, you could pull a double
:entendre out of a randomly chosen page of the bible. So what?

>The point is that when Simon pointed it out to Phil, he did recognise
>what it meant after a moment's thought... and so did I... and so did the
>people who repeated it several times later... so however murky it may
>seem to you, that is the meaning they intended it to have...

I still don't really know if the meaning was intended when that headline was
written, or if it was simply "found" after the fact. The reason I think it
might be the former is that I got quite a lot of abuse along the lines of
"sound-alike" or "double-entendre" at work, in particularly from Steve.
So "double" inevitably came to mean split-personality, "two people in one";
"back" inevitably came to mean "backside", "come" inevitably meant you-know-
what, "split" (well, we'd better split now) again you can guess, "bent" (of
a similar bent), the list goes on forever. These aren't "nice" double-
entendres intended for comedy, they're nasty words to humiliate and cause
pain. If I could turn the clock back three years then I would sue my
former employers for harassment and I would almost certainly win. I had to
take pills after a year of Oxford, so they wouldn't be able to lie their
way out of it. Actually, I could still take them to court - the main
obstacle being that three years after the fact is a bit late and much
of what happened, the details that would be necessary for a case to go
to court, has just been obliterated by time.

Hi Snail

This person Corley seems quite interesting for three reasons. I put the
following at the end of a post in another thread just to see if he was

reading any other threads in uk.media.

It seems he is probably not.

Heres an interesting little story from back in the early days of CCD technology. There was this miniature camera which was designed to fit behind the infrared receiver lens of the remote control system (just beside the IR sensor itself) the camera clocked out the data in 256 lines of 256 pixels from a Fairchild chip and fed it out, a line at a time, into the VBI within the TV set itself. The signal could be picked up remotely from a standard license detector van from where it was stripped out of the surrounding RF signal and relayed back to the TV station where it was displayed as a slowscan monochrome image in a corner of the news readers monitor.

I would go back to single OS for testing. That is, if you have a
socketed 800XL I would just pull one of the XE OS chip from the board
and see if it works when plugged into the 800XL. If the XL isn't
socketted, just stick with the XE initially.

The second bank was probably originally populated by 64kx1 RAMs. You can
either try to find 64k RAMs or 256kx1 chips to start shaking down the
memory expansion.

Seems like there's a lot of wires in there for a 320 XE. Before they
left the Atari market they had come out with a 1 meg memory expansion
daughter board that used the larger chips. Could be that is what was the
original owner was trying to install. If that is the case, you may have
to revert it back to either a stock 130 XE or do a 320k upgrade.

868. FA: Atari 8-bit game cartridges (400/800/1200/XE)

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-09 15:08:41 UTC
From: cph <cph1776@gmail.com>
Message-ID: <1181401721.910800.56230@r19g2000prf.googlegroups.com>
Source record: 4453

I am offering three sets of Atari 8-bit computer/game cartridges for auction

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190121409159
Galaxian (RX 8024), Moon Patrol (RX 8052), Star Raiders (CXL 4011) and Missile Command (CXL 4012)

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190121410461
Donkey Kong (RX 8031), Lode Runner (RX 8082), Mario Brothers (RX 8103) and Archon (RX 8092)
(Note: This lot is XE Cartridges, they may work in older systems as well)

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190121411048
Dig Dug (RX 8026), Joust (RX 8044), Pac Man (CXL 4022), Millipede (RX 8048), Qix (CXL 4027) and Miner 2049er (Big 5 Software)

These worked when I was playing around with them back in the 90's, no reason that they shouldn't work now, but since I have no Atari to test these, I'm offering them on an as-is basis.

Thanks for reading.

Hi,

Last word on this saga. I was able to salvage the Omnimon XL
board. It is sitting very nice and comfy in my 800XL now.

I guess I'll put the 130xe up for parts listing on ebay. Maybe
someone can benefit and I can recoup some expense.

Again thanks everyone who replied.

Dropcheck

You can find SIO cables at some atari vendors such as Best Electronics and
Bravo Sierra Computers.

872. FS: Atari 8-bit 800xl/130xe Enthusiast Lot

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-13 17:00:24 UTC
From: DM Hebert <drizztiger@hotmail.com>
Message-ID: <LoVbi.177137$mJ1.142305@newsfe22.lga>
Source record: 4457

I posted a few months back regarding my Atari equipment I was thinking of selling. Well, I finally pulled it out of storage and will be listing it for auction within the next few days. I am posting it here first in case any enthusiasts would like to make an offer before its auctioned.

In fairness to all, I tested the items for powering up and in some cases booting, but no guarantees are provided and all items are sold as is.
I am selling the entire lot as one and will not sell items individually.

Here goes:

- Atari 130XE Computer w/ 320k Mod Installed (Powers up and boots)
- Atari 130XE Computer (Powers up and boots)
- Atari 130XE Computer (Powers up but does not boot)
- Atari 800XL Computer (Powers up and boots)
- Atari 800XL Computer (Powers up and boots)
- Atari 800XL Computer (Powers up and boots)
- Atari 1050 Disk Drive (Powers up and boots)
- Atari 1050 Disk Drive (Powers up and boots)
- Atari 1050 Disk Drive (Powers up but does not boot)
- Atari 1050 Disk Drive (Does not power up)
- Indus GT Disk Drive (Powers up and boots)
- CSS Black Box (Powers up, not tested further)
- ICD MIO (Powers up, not tested further)
- ICD MIO (Powers up, not tested further)

(Although it's been a while, I am fairly certain one MIO is a 256k version and the other is a 1 Meg version. Again, this is not guaranteed and no promises are made.)

- ICD R-Time 8 Cartridge (Not tested)
- ICD R-Time 8 Cartridge (Not tested)
- Atari 1050 Printer (Powers up, not tested further)
- Panasonic KX-P1091 Printer (Powers up, not tested further)

- Original Floppy Software
- ICD Sparta DOS
- Carina II BBS

- Cartridges
- BASIC, PILOT, ATARIWRITER, FOOTBALL, SUPER BREAKOUT, QIX, MINER 249ER

- Miscellaneous
- Cables and power supplies, various wired and wireless joysticks (haven't sorted through all yet)
- RF connecters, monitor connector, manuals and instructions
- APE WARP+ OS (Not Installed)
- Original 800XL and 1050 Boxes

As you can see, I have quite a bit of 8 bit equipment. I am still sorting through some of the minor items before I list for auction, but the bulk major items of interest are listed above.

If you're interested in making a quality bid before I set an auction, just shoot me an email. I live in the New Orleans, Louisiana area and interested parties are more than welcome to drop by and take a look.

Thanks,
David

873. Assembler Editor

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-13 22:21:55 UTC
From: Payton Byrd <plbyrd@bellsouth.no.spam.net>
Message-ID: <t5_bi.3206$s8.3152@bignews5.bellsouth.net>
Source record: 4458

I recently picked up an Atari Assembler Editor cartridge off of eBay. It appears to be in like-new condition as the book didn't appear to have ever been opened as its spine was pristine and there was no wear at all on the cartridge. Well, as much as I'd like to keep something this hard to find and in such good shape in its box forever, I just can't resist using it because I want to learn to program this beast. :)

So, I got it out and started working with it. One thing is for sure, the guy who wrote the original manual lacked a fact checker because the errata that was included is nearly as long as the manual!

I haven't had any luck saving any sources to WinAPE. These are the results I get:

```
EDIT
SAVE #D:SAMPLE.SRC
WHAT?
```

```
EDIT
SAVE #D:SAMPLE.SRC<$0700,$0906
WHAT?
```

So, what am I doing wrong here? The manual isn't very helpful and the book I have (The Atari Assembler) doesn't even mention loading or saving files.

BTW, I'm using a 1200XL with the standard DOS.

"Payton Byrd" <> wrote in message news:
I recently picked up an Atari Assembler Editor cartridge off of eBay. It appears to be in like-new condition as the book didn't appear to have ever been opened as its spine was pristine and there was no wear at all on the cartridge. Well, as much as I'd like to keep something this hard to find and in such good shape in its box forever, I just can't resist using it because I want to learn to program this beast. :)

So, I got it out and started working with it. One thing is for sure, the guy who wrote the original manual lacked a fact checker because the errata that was included is nearly as long as the manual!

I haven't had any luck saving any sources to WinAPE. These are the results I get:

```
EDIT
SAVE #D:SAMPLE.SRC
WHAT?

EDIT
SAVE #D:SAMPLE.SRC<$0700,$0906
WHAT?
```

So, what am I doing wrong here? The manual isn't very helpful and the book I have (The Atari Assembler) doesn't even mention loading or saving files.

BTW, I'm using a 1200XL with the standard DOS.

You're using the wrong command. SAVE is to write
a section of memory to a .OBJ file, like in the DOS
SAVE command in DOS 2.5.
And the second example is using '$' for a hex address and SAVE only uses decimal numbers. You'll need a hex<>dec calc I would say to do assembler much.
You want to save your source file, you LIST it:
LIST #D:MYFILE.ASM
and then ENTER #D:MYFILE.ASM
To assemble your source, you can first see if
it assembles OK without saving the OBJ file with
just a
ASM (be sure to LIST your source first incase of a crash).
And, finally, (almost) you want to make a LOAD and RU
N, OBJ or .COM file:

```
ASM#D:MYFILE.ASM,#E:,#D:MYFILE.OBJ.
You might want to debug with the BUG command, which you exit from with a
'X'.
Russg
```

```
Uhm.
SAVE uses hex numbers, but doesn't use the '$'.
eg.
SAVE#D:DINK.OBJ<600,700
would save $600 to $700.
(1536,1792 decimal).
I never use SAVE in ASMED.
Now, you wanna use your .OBJ file in a BASIC program?
You gotta pull # args off stack (one PLA).
If you're passing a parameter, then pull two HI, LO
bytes more off stack PLA PLA.
X=USR(1536,16) for example for a OBJ at
$600 and passing a 16 (eg. TAX for an IOCB1 call)
PLA
PLA
PLA
TAX
I could be blathering here, it has been a long time.
```

884. Random number generation?

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-14 18:40:39 UTC
From: Gareth <hotmail.com@dgareth.spm>
Message-ID: <46718b99$0$5867$da0feed9@news.zen.co.uk>

Agh, I've forgotten the main issues - could someone explain?

Iirc the Atari 8 bit computers were unique (in relative terms compared to other contemporary 8 bit computers) in that the random number generator did not use a standard string of numbers.

Is this correct? If so what process did the 400/800/XL/XE use to select random numbers?

Gareth.

There's a 17 bit polynomial (whatever that is) at
53770, which generates a number 0-255, really
fast.
You can PEEK(53770), or LDA $D20A for it.
BASIC gives a 0-.999999 number with:
X=RND(0), which, I would think also uses
the 53770 location, but returns a floating point number.
If your program isn't selecting a random number very fast, you could use the
jiffy clock at 20.

What do you mean by "standard string of numbers"?. What is correct is
that on the Atari, there is no need to use the classical CPU driven
pseudo-random generators (even though some games did, e.g. "Boulder
Dash" did) since there is a pseudo-random generator in hardware.

> Is this correct? If so what process did the 400/800/XL/XE use to select
> random numbers?

It had a hardware register that allowed access to the output of the
Pokey polycounters. The very same polycounter is also used to generate
the "noise" output of pokey, and since the register is reshuffled at
hardware clock speed, and the sampling times are more or less random, an
additional factor of randomness enters the game.

So long,
Thomas

Thanks for the replies.

The "standard string of numbers" refers to, well, the standard string of
unchanging numbers that a number of computers including the Vic 20 and C64
used to generate random numbers.

Gareth.

Most games on the C64 use the whitenoise generator on the SID to get random numbers.

Yes - but greatly improved.

Some Crazy Ideas - For instance...
Incrporating the W65C816S or W65T32 processors

Runs 8-bit Software

Incrporating the expended address range

Or more? .... (Bank selecting)

Incrporating the improved speed

Game Controller Ports

2 ports Minimum

4 ports?

more?

Improved OS

To handle all improvements

Boot loadable

Boot loader boots OS From a Drive

dual pokey

stereo sound

Standard IBM keyboard connection

IDE interface

hard drive usability

cd-rom useability

flash card usability

Floppy drives

True Double density

3.5" compatible

Improved video

Modern Monitor compatible

Switchable 40/80 column modes

Various graphics modes

Other improvements

Parallel port

Serial port

USB interface

Expansion slots

Network accessible

Motherboard to fit standard pc case

To name a few suggestions.

Just a question, how to you plan to keep this compatible to the POKEY
keyboard matrix? Just by adapting the Os, a lot of games will not
work with this modification.

Ditto. A couple of games use direct communications with the floppy
and bypass SIO. (Lucasfilms, for example, does this).

> Improved video
>

Are you going to re-design the chips?

> Motherboard to fit standard pc case
>
> To name a few suggestions.

I wonder what the purpose of this design will be. Having fun designing
it is a good reason for sure, but a standard PC might be easier to get
and cheaper to build. Plus, it can also run Atari games if you want to,
but also a lot more. (And, adding more graphic modes would be a lot
easier and cheaper. Just, it lacks the software to make use of it. ;-)

So long,
Thomas

897. Looking for Analog magazine ad

Newsgroup: comp.sys.atari.8bit

I'm looking for an ad that appeared in Analog for their Analog Compendium book. It was a single page with several screenshots of various programs. The book came out in 1983, and all the issues I have are 1986 and later, so it probably only appeared in the early 80s issues. If someone has a copy of it, could you make a good scan of it for me? Thanks.

Scott

Is it possible to greatly improve on the Atari 8-bit? I thought it was the
best computer ever???

I was seeing IBM keyboard adaptor circuits in a couple of 8-bit sites. I was
thinking that it could be incorporated into the design some how.

Through an emulator - but building it yourself would be more fun.

I have 128K, that's good enough ;-)

Seriously though. It would be nice with a little higher resolution with at
least 16 colors on screen (320*192 with 16 colors is fine, meaning you can
have 16 different colors on each scanline)

Then it would be perfect for making a Shining Force for it.

Hi,

I managed to get an ATARI XEGS, but without Keyboard.

Does anyone here a XEGS Keyboard to sell or swap?
Or can a Keyboard from a 65XE or 130XE adapted to a XEGS?

I dont know if a 65XE or 130XE has the small pcb between the
keyboard-matrix and the mainboard.

I also need a clue where to find the Pinout for the
XEGS-Keyboard-Port...

Many thanks for informations in advance.

Bye
Guido.

Source record: 4495

This project has the foundations of an 800XL, in that it has a 65C02 running at Atari clock speeds and drives sound and baseband RGB video to a TV.

http://www.howell1964.freeserve.co.uk/logic/polymorph_project.htm

It also has code for the AY38910 and POKEY chips, so you can have as many of those as your FPGA can support.

The CPU is rated to 14 MHz, might eventually even run at 14.318 MHz, eight times the original Atari speed.

I plan to have the FPGA being loaded from a Micro-SD card, which will also be used by the CPU for disk storage. I think you could store most of the games ever written for it in a gigabyte card.

> Improved OS - To handle all improvements

Software - yuk! I hope to port disk storage software but that's it.

> Boot loader boots OS From a Drive

Yep, that's do-able.

> stereo sound

Already got it. 8-bit sound for now, but it could drive a modern CD DAC for >= 16-bit sound.

Why not go for 5.1 -channel sound for home-cinema effects?

> Standard IBM keyboard connection

And that. There is logic to translate PS/2 codes to Atari codes.

> IDE interface

Sure, hardware wouldn't be too hard.

> Floppy drives

Hmm, no. Too much effort and circuitry for a medium that is obsolescent. My laptop doesn't have one as standard.

> Improved video

Can do.

> Modern Monitor compatible

Tricky, the timings are very different.

> Switchable 40/80 column modes

Unless you have a very big TV, 80-columns is hard to read.

> Parallel port
> Serial port

Can do.

> USB interface

Done (as a slave so you can use HyperTerminal to cut and paste text to and from the machine).

> Expansion slots

All expansion is done inside the FPGA.

> Motherboard to fit standard pc case

Way too big. I was thinking of a 100 by 220 or 160 mm PCB.

It is 220 mm long now, it should be able to shrink to 160 mm long.

> wondering about dual gtias like dual pokey chips to produce stereo sound -
> just a crazy thought!

Bob Wooley did this and published results in the SLCC. IIRC the 2nd GTIA chip had its own RAM so you could effectively display 16k of screen memory vs. the stock 8k like a GR. 15 screen. It was set up so the GTIAs could take on separate commands, like one in ~16 color mode and the 2nd in 16 lum mode to give 160x200 in 16 colors at 16 lum levels.

He also added a 6545 to get 80 column screens in another issue.

He also added a 65816 which reminds me I still have to dig under a ton of my S.O.'s crap to get out my 800 for some testing.

It was a real valiant effort but the rest of the pieces never came together. Very limited tool set available to take advantage of the hardware enhancements i.e. MAE assembler supported 65816 while MAC/65 only supported 65C02.

Then there is the terminal cheapness, myself included, of the Atari community. Soon as you say "I need 10 people to commit to buy the first 10 boards at $50 each" the silence is deafening.

In the dozen or so years I have been reading this group I have formed an opinion of what it would take to get them to purchase a revised Atari 8 bit. People pretty much expect 100% backwards compatibility with Pentium speed and VGA graphics on demand. You have to run PacMan at normal speed but Atari BASIC 1,000 times faster. You also have to put up with ~"I have a 30 meg SCSI" and "I want it to work with my 40 meg IDE" types who are too cheap to buy a used $5 drive and get offended if you don't have exactly what they need. It is a tough market.

Rick

I remember at least one of the BBS programs on CIS archives was busted.
Had something like over 500 down loads and was never reported before I
caught it. Could have been AMIS or Forem or one of the other popular BBS
programs at the time.

AMIS was really a mess. Spaghetti code that was impossible to follow,
hacked and corrupted by dozens of hands, maximum effective speed of
~1200 BAUD. I can remember it taking so long to load the buffer from
floppy, XModem would time out. I think I solved some of my problems with
it by putting down loads and menu system on a 192k ram disk which was a
problem in itself.

IMO: You would really be better off if you got a hold of one of the
other programs like Carina if you want BASIC or BBCS if you just want
something that mostly works.

Sorry to differ, but I tried both Carina and BBCS.
BBCS was a disaster, from Antic. If I remember I got two or three 'patches'
to BBCS and they still crashed often. Carina was somewhat better, and very
interesting because you could write code to use in it.
BBS Express was rock solid. BBS Express is now in the public domain. BBS
Express Pro! is still sold by Lance Renquist at Video 61, and used in
present day BBS's.
```

I believe Tom Hunt still supports Pro.

I'll defer to Express being the best choice and something I should have
mentioned.

BBCS was ok after you tinkered with it a bit. I can't recall all the
problems but certainly error trapping wasn't what it could be. It
allowed to do things like create a menu heading that you didn't have a
menu for. I bought a printer just to print out what seemed like 40 pages
of docs. Anything you need 40 pages for documentation is not going to be
user friendly!

REAL FOGGY
As the disk was supplied, the duplicated disks all contained truncated
file error or some such for the message base compaction program.

That being said, after about 6 tries at 'construction' I got a version
that worked OK and was fairly stable on a minimal system: Two 188k
floppies and a 192k ramdisk under Sparta DOS. I think I just ran it with
a 1030 with a J/S ring detector hack.

Rick

Ahh. You were using a 1030. That could explain its' funtioning. I'm sure
by the time I tried BBCS, I was using a avetex (?) 1200 baud modem. I think
I was shopping for a BBS system software because I changed from my MPP 300
baud joystick port AMIS MPP, (now who wrote that? I bought it.) I also
tried Carina, and it was somewhat unstable. I finally spent the $50 (I
think) and bought BBS Express from Keith Ledbetter. It never caused any
problems, always worked. I didn't have a UPS, but I made my BBS so that if
there was a power out, I batch filed about 4 floppy drives and a 1 meg MIO
to come back online as soon as power was restored.
I considered my batch file, in SpartaDOS, to be a really neat capability of
the setup.

920. My Vintage Computing Files Archive

Newsgroup: comp.sys.atari.8bit
Date: 2007-06-21 03:48:18 UTC
From: hexstar <hexstar@gmail.com>
Message-ID: <1182397698.703755.237960@j4g2000prf.googlegroups.com>
Source record: 4406

It is my belief that archives like this one should be provided without any limitation to the end users ability to utilize the archive. These archives are getting harder and harder to find and because of that we all should do what we can to let those who want to mirror our archives do so. As such I am now bringing this archive to the vintage computing community. I have not and will not put any limitations on how users can utilize the archive provided here. Users can freely download as much or as little of the archive as they want. Users can also freely contribute as much or as little to the archive as they want. This way people will be able to mirror the archive easily which will help ensure the files contained in this archive have a nice long life span. This will also allow this archive to grow freely and become an ever increasingly useful resource to fellow vintage computing hobbyists. It is my hope that people will take advantage of the great disk space and bandwidth provided here and both contribute to and download from this archive. This will allow users to have a good solid place to go whenever they are in need of a file for their vintage computing hobby. With the resources provided here it is my hope that with others contributions and utilization of this archive that this will become a great resource for all vintage computer hobbyists. That's right, there is no certain vintage computing era this archive is limited to (except the 2000+ computers and their related files), as it is my hope that this becomes a great central archive of everything vintage computing. A resource that makes the vintage computing hobby easier and less intimidating by not requiring hobbyists to go all over the internet for the files they need. Hopefully someday this goal will be met for the benefit of everyone who enjoys vintage computing as a hobby. Enjoy! :-)

FAQ

Where are the files?

The files are hosted on a KDX server. This provides me with an easy to administrate server and it provides everyone else with a nice, easy to navigate, server with which you can download/upload files and chat. If you don't know what KDX is click here for details on what KDX is and how to use it as well as download links for the client. To connect simply use kdxvcfa.dyndns.ws as the address, a username/password is not necessary.

What about http/ftp access?

You can still access the archive via http by clicking here, however note that the http copy of the archive will no longer be updated. Instead it is highly recommended that you use KDX to enjoy the latest

additions to the archive. The same goes for ftp uploading, please upload via the Uploads folder in KDX instead as the archive will now continue to be maintained only via KDX.

Why the change to KDX?
Http access was great for a while. However, http access was being donated and as such disk space was limited. The donated disk space is now getting tight and as such I had to think of alternative methods of keeping the archive online. The best way I could think of was to host the archive myself since I have a bunch of HD's here which thus provide plenty of disk space for the continued expansion of this archive. I could easily have setup http access myself but I thought that since I was doing the hosting myself I might as well use KDX. Why? It's easier to administrate, the administration interface provides many easy to utilize controls for what users can and can't do. It has everything for the makings of a community, file browsing for downloading/uploading, a chat room, private messaging support, and a news section. In addition KDX is completely free and has clients for all the best operating systems: Linux, Mac OS, and Windows so no matter what OS you use you can still enjoy this archive. So now the archive is being provided and maintained via KDX.

How can I contribute to the archive?

To contribute to the archive simply upload your files in the Uploads folder

To expedite the sorting of uploads please do the following when uploading files to the archive:

* Look for a folder corresponding to the type of computer your files are related to (Apple, DEC, Commodore, etc)

* If one exists go in it and place it in the correct category sub folder (e.g. Utilities, Multimedia, Office, etc)

* If the folder corresponding to the type of computer your files are related to doesn't exist or the correct category subfolder doesn't exist create it and place your files inside of the folder (if you create a category subfolder for a category that doesn't exist publicly and your files are determined to be able to be legally hostable, the new category will be created publicly with your files inside of the new category)

This will help speed up the sorting of the uploads by avoiding mess and clutter as much as possible. Thanks! :-)

Uploaded files are not instantly made publicly available as it is necessary to review the files for possible legal issues which could prevent them from being able to be shared publicly on the server, the upload folder is checked daily and any newly uploaded content that is deemed legally sharable (e.g. abandonware and/or software which was made by a company that no longer exists or still exists but has long

since abandoned the software and does not care if the software is shared) will be sorted in the appropriate publicly accessible folders.

What era or type of vintage computer related files are allowed in this archive?

There is no specific era or vintage computer that this archive is restricted to as long as the file(s) don't relate to any computer made in 2000+. It is my hope that this becomes a great central archive of everything vintage computing. A resource that makes the vintage computing hobby easier and less intimidating by not requiring hobbyists to go all over the internet for the files they need. Hopefully someday this goal will be met for the benefit of everyone who enjoys vintage computing as a hobby.

Why should I contribute to/download from this archive?

This archive is unique in that it is maintained with the belief that there should be no limitations in place for how one can utilize this archive. This archive is hosted on a server with 200GB of disk space and 2.8TB of monthly bandwidth, this ensures that everyone can enjoy the archive equally. In addition this archive is hosted in a state of the art data center in the USA, this means that the server has high upload and download speeds, something not every vintage computing archive has unfortunately. The high bandwidth and disk space available for everyone's use ensures that everyone can equally enjoy this archive with nice fast speeds both up and down. This in turn makes it easy for people to download the files they need and for people to contribute to this archive without spending a lot of time doing either. In addition every file uploaded is backed up locally so that if the hard drive in the server goes bad the files will not be gone and can easily be reuploaded (and they would be as soon as the hard drive got replaced). Not only that but because I encourage people to mirror this archive you can rest assured that I will not be the only person with a backup of this archive so that these files will have a good, long life span.

Do you backup the archive?

Yes I sure do. Every time I check for new uploads I backup the uploaded content locally onto two hard drives.

Can I download the entire archive?

Yes! You certainly can using something like wget. I do not believe in limiting the potential of these types of archives as explained above and as such there is nothing stopping you from downloading the entire archive. In fact I encourage people to mirror this archive as it'll help ensure that the files stay around longer. Also note that while we won't stop people from downloading the whole archive for their own personal use (i.e. they have no intention of later sharing the archive with others) it is preferred instead that in this case files are downloaded individually as needed.

What can I do if I find one or more files that are wrongly categorized?

Please email me at hexstar@gmail.com with the location of the file(s) in question and the location where you believe they should be moved to.

How can I contact you?

You can contact me at hexstar@gmail.com

It's not so much as I'm looking for a specific BBS to run - it's that
I want all of them ;)

I ran a superhacked AMIS (as did most of us at some point, I assume) -
later I switched to Express, and somewhere in there Oasis Jr.
Most of my friends ran Carina, Oasis III and IV, or just bit the blue
bullet and ran the bbs on an IBM clone of some kind.

I also had the ring detector.. I thought that was the cleverest thing,
course, I think I was 11 or 12...

Russg,

The file I use a lot is ' UNMAKATR.EXE ' will extract bootable basic .ATR's.
By Ken Sider (sp) on this webpage
http://atari.ksiders.tzo.com/a8emulators.html now combined into one download
called atrutils.zip..
Good Luck

Opps,
I just tried this and it doesn't like basic files. But it does work on
'K-files' short atr's made with makeatr.exe

http://www.atarimax.com/jindroush.atari.org/asoft.html has the BAS2BOOT.EXE
and sources, but I didn't find a program to reverse the process.

Russg,
Try loading program into the Emulator, then break key and LIST "P:"..or SAVE
"H1:filename.bas. Enter it back into the emulator and SAVE
"D:FILENAME.BAS. Or break key then ALT-'1' to change disk then SAVE
"D:FILENAME.BAS". If you have a hex editor strip the first 258 bytes off
the ATR and save file as FILENAME.BAS.. I have probably missed a step or
two but I have used the hex editor method and it works..
I don't seem to have the file -----starbase hyperion atr------ or I could
email the file to you.

:) Reminds me of the "digital data porn" which had an icon of a woman licking an Atari joystick. That was actually as riskay as it got though. It was a site that catered to geeks and therefore had a lot of retro pictures in it. Some good pictures at that. Some computers even with their tops off. :P

Just downloaded Atari Win Plus version 4 - require OS ROMs to get it going.

Please advise where I can get them - have googled for 1/2 hour, no joy.

Thanks, regards, Robert.

I believe that the site you downloaded Atari Win Plus version 4 should have
the roms or a separate link. Try this one..
http://www.a800win.atari-area.prv.pl/xf25.zip

Good Luck

Thanks - I was unaware of that. Is Xformer a good emulator? The one
I got ATM (Atari Win plus) seems good.

943. lost game title from my youth.

Hello all,

I have recently started to rebuild my Atari 8-bit collection an library after it was stolen almost a decade ago. There is a game that I used to play and wanted to show my friends son who is into this stuff as well but I can not remember the title of the game. I remember it is a space game along the lines Star Raiders but when you dock with the space station a guy in a space suit would drift out and repair and refuel the ship and then drift back by waving at you as you departed.

I thought maybe one of you fellow Atari fans may know of the game I am seeking and can direct me to a archive that may have it or place I might be able to buy it.

Post here or shoot me an email at jerry.young@gmail.com

Thanks.

It was a first person type game. Though I do like the looks of that
game and will see if I can find it.

The pluses are things like it has a small footprint, fast, and is stable. I think the DOS version will just about run full speed on a 286/386SX with VGA graphic card an 20 meg MFM hd.

It has the most trouble with running the tough stuff like Alternate Reality and sound reproduction. I think the other emulators run more software and more accurately.

Rick

Yeah it is a hard one to remember but I do remember it. It was kewl
game, as you approached the space station and got within range the guy
would fix your ship.

949. Vintage Computer Festival Midwest 3.0: July 14-15, West Layatette, IN, USA

Newsgroup: comp.sys.atari.8bit

It's just 3 weeks until the third annual Vintage Computer Festival,
Midwest edition. We've got a few interesting speakers lined up, and
more to be added shortly.

So come all ye collectors, see the speakers, and even exhibit your
favorite items from your collection! We still have plenty of space to
fill up with exhibitors. If you're interested in being an exhibitor,
please sign up before Sunday, July 8th. Don't wait until the last
minute, or there may not be space left!

VCF/Midwest 3.0 will be July 14-15, at Purdue University's Stewart
center. Speakers will run from 11a to 2p each day, and exhibits and
the marketplace will be open from 2p to 6p. Admission is $5 per day
for access to the whole event, and kids 17 and under get in for free.

For more details, and to sign up as an exhibitor or vendor, please see
the official VCF/Midwest 3.0 website at:
http://www.vintage.org/2007/midwest/index.php

If you have any questions, feel free to send me a message at:
vcfmw at computer-refuge.org.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

Hey, what is this game? Never seen that title before. Have Trivia Arcade,
Quest and a couple of others, but this one was new to me. Any info on it?

Remember, this and all the currently active Atari BBS's are available at the
Atari Gateway...

telnet://pb.darktech.org

Get to the main menu, x for internet, A for Atari, and all the Atari BBS's are
listed there.

I believe when you reach ST Guild and Dark Forces you need to hit return,
otherwise nothing will ever show up.

Just thought I'd let everyone know, I'm having trouble with my UDS10.
Whenever a call comes in, it acts like it accepts it, then the red
diagnostics light comes on, and the call will not continue...

So we might be temporarily unavailable until I can figure out what is
going on with it.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.

comp.sys.atari.announce

Hi and tnx for reading my message.

I've renctly played a game called "New York City" where you drive a car
and if you park it, you play a little guy.... but after playing a while,
I still don't understand what I need to do ?!!!

Any help will be appreciate.

tnx in advance

```
* THE BIG APPLE *
(NYC)

OBJECTIVE:
----------

As a visiting tourist, you must visit
12 locations in New York City within a
specific amount of time. The locations
are:

LOCATION SYMBOL
-------- ------
EMPIRE STATE BUILDING ES
UNITED NATIONS BUILDING UN
GRANT'S TOMB GT
WORLD TRADE CENTER WT
CITICORP CENTER CC
CITY HALL CH
CENTRAL PARK ZOO ZO
POST OFFICE PO
AUTOMAT AU
MART MA
BANK BA
SUBWAY SU

The BANK and the SUBWAY are always
open during the game. All other
locations are open only when you see
```

their two letter symbol at the top of screen under SIGHT. In addition to these 12 locations, you will see 3 other locations:

LOT: You must retrieve your car from the lot if it is towed. To get your car back you must pay $90+$20 for each 7.5 minutes on the game clock.

GAS AND GARAGE: If you are involved in an accident or run out gas, your car will be brought here. When you pick up your car, your tank will be full and you will be charged for the gas and $50 to $350 for repairs. You may buy gas voluntarily by parking and then going into the building and position the man in the top center of the screen. Then hold down the fire button and your gas supply will go up. You will be charged $1 per gallon.

HOSPITAL: If you are hit by a vehicle while walking, or if your car is hit by blue tow truck you will be brought here to recuperate and will be charged $200.

Each time you start the game, all locations are randomly placed except for:

ZOO : Always in Central Park.
GARAGE: Always at the east end of Central Park
SUBWAY: Entrances are always on the street that runs along the south edge of Central Park.

DRIVING THE CAR:

Your car is the blue car in the center of the screen. You can drive it forward by moving in the desired direction the car is facing. To stop, simply release the joystick. You can turn 45 degrees from your current direction by moving the joystick in the

desired direction.
If you park your car and your meter expires, you will get a 'METER EXPIRED' message.
If you run out of gas or your meter expires, your car will be towed to GAS AND GARAGE, and you will become a pedestrian if you weren't already one.

BEING A PEDESTRIAN:

To enter any of the 12 locations you must visit, you will have to get out of your car. Getting into an accident with the blue tow truck will get you out of your car automatically. A better way is to pull into parking space or parking space or parking lot and push the joystick button. Pushing the button will get you out of your car only when you are legally parked or out of gas. To enter a location, just walk in the front door. If you don't disappear in-side, you are not lined up with the door. To get back into your car, stand on the left end of the car and push the fire button. If you leave your car parked too long, the tow truck will come to tow your car away to the lot.

THE LOCATIONS:

Empire State Building (ES), United Nations Building (UN), Grant's Tomb (GT), World Trade Center (WT), Citicorp Center (CC), City Hall (CH). These six locations have the same objective but each one will be successively more difficult. You must make your way to the top of the grid of platforms and ladders, grab the pretzel or key, and exit the bottom of the screen without running into the men who are chasing you.
If you get caught, you will lose $50 and have to start again at the bottom of the screen. The two men who are chasing you can bridge the gaps which might be present. You must try to lure the men to the necessary place.

CENTRAL PARK ZOO:

Someone has let the animals out of their cages at the zoo! The animals must be put into separate fenced areas. To lay a fence, hold down the fire button and move the joystick. You must fence each animal so that it is completely surrounded by fencing or walls. You may freeze caged animals by moving to the top of the screen and pressing the fire button. Each caged animal will then be frozen and $25 dollars will be deducted from your money. You must freeze all the animals to complete this segment of the game. BEWARE! The animals bite (including frozen ones) and each bite costs you $50 and you must start again at the top of the screen.

POST OFFICE:

The Post Office is the most difficult of the locations to complete. The object is to grab the letter, place it on the empty stamp pad, wait for it to be stamped, take it off the stamp pad, climb up the ladder and put it into the white mail box at the top of the screen.
The Post Office is divided into several colored bands. You must use the fire button to jump from one color up to the next. To move down the screen to a different color, simply move the joystick down.
Your first task is to get the letter you are trying to mail. You must chase the letter and jump if necessary to grab the letter. If you miss, you will be charged $50 and have to start over at the bottom of the screen.
You must next get through the moving mail carts and past the dog to the stamping pads. Touching either the mail carts or the dog will cause you to start again at the bottom of the screen. Since the dog will follow you, try luring the dog to the far left of the screen and then dash to the right while avoiding the mail cars. Your letter must next be stamped. To do this, position yourself next to a

stamper. Wait until your stamper stamps and then jump onto the pad and quickly get out of the way. If you fail to get out of the way, you will also be stamped, lose $50, and have to start over. If your letter is successfully stamped, you will start with your letter on the stamp pad any time you are forced to start over.
Next you must take your letter off the pad and put it into the white mail box at the top of the screen. You must retrieve your letter from the pad by jumping onto the pad. You must then jump onto a ladder and ride the ladder until you can drop your letter into the proper mail box. You may not ride a ladder off the edge of the screen, so it may be necessary to move off a ladder temporarily. To do this, move your character down off the ladder by moving the joystick down. Be sure you do not exit onto a stamper!
Once your letter has been dropped into the proper mail box, you must make your way back to the bottom of the screen while avoiding the dangers you have just passed. You must repeat this process with another letter to complete this location.

AUTOMAT:

At 10:00, 2:00, and 6:00 on the game clock, IT'S MEAL TIME will appear. All locations except the automat, bank, gas and garage will then close until you complete the automat location.
The object is to eat 10 hamburgers. You can order your burgers by moving to the top of the screen and pressing the fire button. Each time you press the button you will be charged $20 and a burger will appear on the screen. You must catch 10 burgers while avoiding Felix Hunger who also has designs on your burgers. Getting bit by Felix costs you $50.
When you have ate ten hamburgers, congratulations! You are done.

I know, I am getting old. Never even seen this, but then again, I don't have
all Antic's. Anybody have a clue on where to get it? Ben Smith? You got it?

I don't know of any of the emulators that emulate an XEP-80. Remember that the XEP-80 is an external device that the Atari talks to over a joystick port. To emulate this, one would need to build emulation of this device and its connection to the joystick port into the emulator.

It would be a very cool addition to an emulator. The XEP-80 could be emulated as a seperate display window from the main display.

Was there ever any clones made of the Atari 8bits? The Apple][, Timex
Sinclair 1000, TI 99/4a had theirs (not sure about commodore though).
Did Atari have any?

The Soviets were prolific at cloning Commodore machines. Occasionally you see reference to a soviet-made Commodore disk drive or printer. I think they had major problems with chip production and the systems wouldn't run for very long.

I wonder if you could have cloned the Antic chip? Can you replicate it
using dicrete logic chips like you can the ULA (similar purpose on the
TS1000)?

The Atari 8 bit machines and also the C64 used too many and too complex
custom chips to easily clone them. That's why it never was done.

For the Apple, there were some remarketed //e|//+ machines made by Bell and
Howell for the schools. Then there were the Laser series which were completely
a clone but licensed the prom from Apple. As for the atari, I've never heard
of a cloned machine as availability seemed to be good in the places it was
marketed. But as another poster said, maybe there were russian counterparts
made tho I find it unlikely as the commodore really had a big influence
overseas.

At the time and I think it was at least half to do with proprietary
chips at Atari vs. the available chips in some of the others.

Just as a ~loose example: The TI99/4 used a video chip that was marketed
as a separate chip and the manufacturing was licensed to other companies
like Yamaha. Some flavor of the chip found its way into Coleco
Vision/Adam and the NES. Circuit Cellar even made a board for the Apple II.

The TI chip was a display chip with its own RAM and refresh circuitry.
It had the capability of sprites vs. P/M graphics and if you recall the
NES and Coleco Vision games of the era, was quite capable.

The NES on a Chip devices that are commonly sold for <$20 in toy stores
clone both the 6502 and the 9930<?> video chip. If they can clone a 6502
processor, they surely could clone an Antic video processor and GTIA.

Personally I think it would make some sense to do. I mean some of those
games that come with the NES on a chip are really lame. Stock shoot 'em
up Scramble clones abd scrolling racers similar to River Raid. I would
much rather play something like Start Raiders myself if they could get
around the keyboard controls needed.

While the commodore 64 when it was released was $595 and the Atari 800 was priced around $999. I am sure could not be true. I do know that the Commodore 1541 was a slow drive. We could ask some Commodore users, but I do not think they have upgraded to PC's yet because they are still trying to load games the got from 82 that have taken all this time to load.

Ofcourse. Speccy was mostly cloned because it could be built from the
soviet Z80 clone + standard TTL components.

> If they can clone a 6502 processor, they surely could clone an Antic
> video processor and GTIA.

The 6502 only has a few thousand transistors. It's a very small and
simple circuit compared to (for example) the SID or the VIC of the
C64 which have several times more transistors. Also it was a matter
of what the military needed. It was soviet zone, everything which
was high tech was developed for the military, and they needed CPUs
but they didn't need sound and video chips for games.

990. Adult sex personals . where to meet women . meet women for sex . love hina sim

Of course. It's only a chip.
Mostly digital, with a bit of analogue.

I've got the POKEY sound logic running in my FPGA.
I've got a VHDL video controller that has cycle timing based on the ANTIC, I
just need to add logic to change modes based on the display list...

Highly unlikely. The Atari was a damn expensive computer to get into
compared to most of it's rivals.

BTW, it's kind of pointless starting a topic with a 4-day expiry.

996. Re: Random number generation?

Newsgroup: comp.sys.atari.8bit
Date: 2007-07-13 05:00:12 UTC
From: Rybags <rybags@tpg.com.au>

Source record: 4383

Obviously, a "standard string of numbers" is referring to the
predictable sequence that seeded RND() functions generate.

The C-64 just like the Atari has a hardware function to generate
better "random" numbers - it provides the amplitude output from Voice
3 (which obviously has to be set to white noise to generate random
numbers).

The difference with BASIC is that the Atari utilizes the hardware and
the C-64 doesn't, since it's BASIC is virtually unchanged from the PET
days.
The Atari just reads $D20A and throws out values that aren't valid BCD
numbers.

You can, but it is a highly complicated thing to do. You would need
as much ICs for replicating an Antic with TTL and other ICs as you
would need for the entire rest of the computer.

I remember that some Amiga prototypes used TTL logics to simulate
the Amiga blitter and other custom chips. Every simulated chip
had an entire PCB with lots of logic on it.

Another problem is that it's not that easy to reverse-engineer
complex chips like Antic. It takes a lot of work to reproduce it's
exact behaviour in every aspect, and as I said: This work was only
done if the military needed it.

> done if the military needed it.

FWIW: I just had another foray into the wonderful world of micros. Last time, circa 2000, I had trouble even buying chips or getting a manufacturer to return calls or email. I think I was 0 for 20 or so.

About the only thing I could find was obsolete DSP chips and $600-$7,000 developer kits. I think everything was being sucked up by the cell phone manufacturers.

Anyway, I am revisited the H8 since I have 3 or 4 working systems and just bought a working GPS board with an ARM processor. I checked with Digikey and both processors are available and at least for one, a <$60 developer kit is available.

Both of the processors I am looking at are 16 bit and various flavors of C are available free or with the developer kit.

I may not have the details exactly right, but the H8 is a derivative of the 68000 and Hitachi even sued Motorola for using some of its advanced technology in the 68030. Fast puppy anyway, 25mHz with 512k flash and 16k RAM for less then $20.

Point being in the H8 case, most of the integration you would need to make an Atari is already there. Comes with I/O lines that could do everything from read keyboards to D/A and A/D to do sound and controllers. If Xformer could run on a 8 mHz ST, it should be a lock to

do with something like the H8.

The ARM I got with the GPS board is interesting on a couple of levels. It has ~the same processing power as a 386 and is in circuit programmable/upgradeable. Most of the stuff I said about the H8 can be said about the ARM too plus a low price of ~$5 each. It is a RISC processor so it is the equivalent of an evolved ANTIC. People have hacked PIC and Atmel microcontrollers to do VGA graphics after a fashion. If an 8 bit PIC can do it, you just know an ARM can do it better.

At this stage I don't think we want want perfect clone as much as current technology. I mean I have a bunch of Atari computers so why would I need to buy a another one? It had better do several things better then the original like use less power or have better video output.

IMO, the next iteration would be to go the emulator route. Use something
like Linux to bootstrap an emulator. It's a lot easier to add "hardware"
to an emulator. Since old Pentium's are so cheap, this would allow the
Atari 8-bit to live on. Plus, the emulator can be ported to all sorts
of operating systems.

Is there any emulators that support dual GTIA chips? 80 Column hardware?

Just my op but I like the idea of a low power system, maybe .5 Watt so
it could be done with batteries.

There's a small footprint linux for portable devices, used on cell
phones and GPS<?> systems, but I worry it will go the same route as the
other OS. With very few exceptions, when I look at someone else's code I
can't figure out what they are doing which is scary. I'm not your
average idiot, I consider myself and standout idiot!<grin> I aced C
programming when I took it so I think people are deliberately trying to
create obtuse code to be cute.

I took a look at the old ST Xformer for reference. It was only ~127k of
mixed C and ASM code and ran ~80% the speed of a real Atari. Micros with
more then that amount of flash are common now. You could do 40 mHz ARM
with 512k flash and have everything but the variables in flash including
anything Atari you wanted like OS and BASIC ROMS. Most micros don't have
a lot of RAM, maybe 2k-16k on chip. That isn't a lot but it could get a
minimal system going w/o having to add an external RAM.

> Is there any emulators that support dual GTIA chips? 80 Column hardware?

Currently, not really. As for dual GTIA, please propose a duable and realistic hardware design how to fit two GTIAs into the system - where for example is the data input of the GTIA coming from? Dual ANTIC? Where are the memory cycles coming from to feed it?

As for 80 column output, there are a couple of preparations in Atari++ to make this possible hopefully in the near future, I'm just lacking proper documentation for the XEP-80 to really do it right now (see the xepbuffer classes). The second question would be how much software does really profit from this, so is it worth the trouble.

So long,
Thomas

What would you need for that? The driver source that came with the
XEP-80? The XEP-80 itself?

Bye Jochen

1005. NEW Item from More Than Games

Newsgroup: comp.sys.atari.8bit
Date: 2007-07-17 04:28:08 UTC
From: Rick D <a8maestro@a8maestro.com>
Message-ID: <469C4558.65DD1FE0@a8maestro.com>
Source record: 4392

Hello,

I have just released a new set of items. The EASI/O SPIDER. it is a professionally made circuit board that holds up to 4 SIO jacks and/or 5 SIO cables. With other features including an EASI/O port, internal upgrade header, prototyping area, and external power support.

Available in pcb only for $12.00 +Ship/hand/tax/paypal fee, thru assembled kit.

View the information at...www.a8maestro.com/sites/mtgcat/proda8/a8-p1.htm.

Please see the current email on the page for any questions.

More new Items coming this summer.....Stay tuned.

Thanks,

Rick D.

1006. Translator Tape?

Newsgroup: comp.sys.atari.8bit
Date: 2007-07-18 09:28:51 UTC

When Atari released the 600/800xl, did they ever release a translator tape for those who didn't have a 1050 drive?

Bill H

I don't think Atari did it, probably some user
made the Cassette version from the disk.
I'm pretty sure it is TRANSLAT.CAS available
at www.atarimax.com down the page in the APE/PRO area download APE118d.zip.
APE for DOS area.

I said where to get TRANSLAT.CAS, at atarimax.
But, hmm.... How to use it?
You might be able to use it in emulator, but why do that, just use the 800
OS?
You might be able to, in FTeDOS:
COPY D:TRANSLAT.CAS C: after booting
from APE. But if you have APE working, why need a CAS file? It is possible
APE118d supports a CAS file like it does ATR files.
OK, I'm trying to present a solution without knowing what the problem is.

1009. Re: Translator Tape?

Well,
Atari themselves did NOT release a translator tape. But some Atarians
did, because so many versions of the Translator were floating around, it
was treated as being "PD". I would look for a translator version, that
supports both Disk + Tape boot (e.g. Power-Play, Ultra-Translator, etc.)
or even Disk + Tape + Cart. boot (like Ultra-Translator)... -Andreas Koch.

1010. ADOPTION: PORTLAND, OREGON USA!

I've played the game for several hours during 2 days and I really
enjoyed it !
It's a nice game, different to what I've played.
I've just finished the game and my level is: "Brooklyn Commuter Class
2"... How bad is that ? :o)

In my opinion the Atari 8-bit had a great Sound system.

I remember how easy it was to program and produce some
really interesting sound effects.

Anyone know more technical details on the sound system.

I'd like to know if stereo sound is possible and what kHz it was
capable of producing when digitising Voice and other Sounds,
or does that depend on the type of Digitiser used?

It is possible to upgrade the machine for stereo using another Pokey chip;

http://atrey.karlin.mff.cuni.cz/~pavel/atari/pokey.html

Alone it was capable of 16 bit sound. Datasheet is found here;

http://homepage.ntlworld.com/kryten_droid/Atari/800XL/atari_hw/pokey.htm

Mark

That auction doesn't have any bidders yet, so you may be right, his price is high. I can say that a new 130XE from Video 61, Ben Smith, B&C will cost you about $100, if I remember. Otherwise, someone may have one to sell that isn't as clean, with box and original styrofoam. I dunno. Good luck.

I checked. Video 61 didn't seem to have any.
Bravo Sierra had, I presume used ones, for $75 with power supply.
B&C (www.myatari.com) had new ones for $150.

1026. Re: WTB: 130xe

Newsgroup: comp.sys.atari.8bit
Date: 2007-07-26 00:27:27 UTC
From: Demivec <likeb4garbage@msn.com>
Message-ID: <f88pol0h9q@news2.newsguy.com>
Source record: 4263

I have a 130XE (used by me) available for sale.

It had a memory mod (in 1987) to upgrade it to 1mb Ram. and included the addition of 3 switches on the back relating to the memory upgrade.
I did not perform the upgrade, and frankly do not remember the gentlemen that did, though he was a popular name in the biz at the time for upgrades.
I did work to write software to use the extra memory, so I am familiar with its workings somewhat.

It is in fine working condition. Keyboard works.

I'm asking $60 for the 130XE.

Demivec

I also have an excellent monitor for it and some odds and ends such as disk drives available that I used with it. The monitor was much better than a TV and used a split cable, not a switchbox for the signal. The monitor viewing area included areas normally in the overscan. No doubt it would be more costly to ship if the monitor was included.

I'm interested in this machine. First come first served, or just the
original poster?

thanks

First & highest usually works best. Contact me at likeb4garbarge@msn.com
by taking out the garbage first, and I can answer any additional questions
you may have before we close the deal. I do have pictures as well.

A LISP cart for the 8-bit? I didn't know there was one, but that would be
way cool to have...

is he thinking of PILOT? I don't think there was a cartridge Lisp for
the 8bit Atari's.
```

```
********
*HACKER*
********

Total Spoiler below

To get past the data check of the sru if you do not use the password,the
points are as follows;

INFRARED VIDEO IMAGE SENSOR:
This is located at the back of the head,Place the cross hair on the
black strip near the top,then press the F/B.

ASYNCHRONUS DATA COMPACTOR:
Place the cross hair at the joint between the "hand" and the "arm",
press the F/B.

HYDRAULIC MOTIVATOR:
Place the cross hair in the box on the side or the SRU, which is
outlined in yellow. Place the VERT] line of the cross hair just inside
the box on the right side, press the F/B.

PHLAMSON JOINT:
Place the cross hair just above the axle on the small rear wheel,
with the VERT. line on the axle. Press the F/B.

THELMAN PORT:
Place the cross hair at the end of the black pipe coming out of the
left side of the SRU. Press the F/B.

*NOTE*
If you do not get all of these correct you will have to redo the test
until you get them all correct, the first time!
```

PASSWORD =AUSTRALIA

WORDS TO GIVE TO THE SATELLITE WHEN IT DOES A SECURITY CHECK. The words MUST be entered just as shown:

MAGMA, LTD.
MODEL # AX-0310479
HYDRAULIC
AUSTRALIA

These words are not in the order asked for, so make sure you use the correct word.

THIS THE ORDER IN WHICH TO GO TO THE DIFFERENT PLACES AND WHAT TO BUY-GIVE FOR THE INFO YOU NEED. In order to buy, when you get to the location you want Press "U" to go to the surface, then press "I" after the port opens, Press "c" to call the spy. He will say something to you. To make an offer Press "I" to select the item to offer, then Press <RETURN> to offer it to him. After your done with your transactions Press "D" to leave.

Press "M" to read incoming messages.

Total Spoiler below

1. SWITZERLAND -GIVE HIM CASH,BUY THE CHALET AND THE CHRONOGRAPH.
2. EGYPT -GIVE HIM THE CHRONOGRAPH,BUY THE SCARAB AND THE TUT.
3. GREECE -GIVE HIM THE SCARAB,BUY NOTHING.
4. INDIA -GIVE HIM TUT,BUY NONTHING.
5. NEY YORK -GIVE HIM THE SWISS CHALET,BUY THE STOCKS
6. JAPAN -GIVE HIM THE STOCKS,BUY THE CAMERA AND THE PEARL.
7. CHINA -GIVE HIM THE PEARL,BUY THE SECOND ITEM HE OFFERS TO YOU.

DON'T HAVE ANYMORE HINTS

1037. Re: Looking for the solution of "Hacker"

Newsgroup: comp.sys.atari.8bit
Date: 2007-07-29 10:38:40 UTC
From: Andreas Koch <andiko.nospam@web.de>
Message-ID: <f8hqo0ivd02$1@news.t-online.com>
Source record: 4274

```
Err well,
the only solution I have for "Hacker" is written in german language
(search for a good translation program)... -Andreas Koch.

--------------------------------------------------------------------------

*********
Hacker:
*********

Allgemeine Tips:
----------------

1) Es ist egal, wie oft man von dem
Satelliten beruehrt wird. Folgende
Codewoerter werden waehrend des
Spieles abgefragt:

a) Name der Firma: Magma Ltd.
b) Seriennr. des SRU: AX-0310479
c) Antrieb des SRU: Hydraulic
d) Firmenstandort: Australia

2) Man darf sich kein einziges Mal
verfahren, da das Zeitlimit genau auf
den kuerzesten Weg abgestimmt ist.

3) Um das Einstellen am Roboter zu
umgehen, sofort nach Logon Please
AUSTRALIA eingeben.

4) Die ZEITSKALA so stellen, dass am
rechten Bildschirmrand noch 3 Reihen
im Dunkeln liegen (wichtig !!). Nur
CHINA, JAPAN und INDIEN duerfen im
grauen Bereich liegen...

5) Da nach etwa 7 Stationen die SRU
unsichtbar wird, muss man sich
anhand der Toene orientieren...

6) Die Loesung:
---------------

Zuerst in die Schweiz (6 rechts, 4
hoch) fahren und die 5.000$ abgeben.
Kaufe THE DEAD OF A SWISS CHARLET
und den CHRONOGRAPH. Danach fahre
```

nach Aegypten (4 links, 1 hoch, 6 rechts, 2 runter, 1 rechts) und gebe dem Agenten den CHRONOGRAPHEN. Nehme von dem Agenten beide Gegenstaende (SCARAB und STATUETTE). Dann fahre nach Indien (1 rechts,3 hoch,2 rechts, 3 runter, 1 rechts) und gebe die STATUETTE OF TUT ab. Von dem Agenten >nichts< kaufen.

Nun fahre nach New York (1 links,3 hoch, 16 links, 1 runter). Gebe THE DEED OF A SWISS CHARLET ab. Von dem Agenten >nur< STOCKS & BONDS nehmen. Darauf begibst Du Dich nach Japan (6 links,1 hoch, 14 links,2 runter,5 rechts) und bietest dem Agenten STOCKS & BONDS an. Nun beide Objekte (35 mm CAMERA und CULTURED PEARLS) annehmen.

Weiter geht's nach China (4 links) und die CULTURED PEARLS abgeben. Vom Chinesen >nur< JADE CARVING nehmen. Nun fahre in die FALSCHE Karibik. Dieser Ort ist auf der Karte nicht eingezeichnet, entspricht aber dem Ort, der vor der Kueste von Brasilien (Suedamerika) liegt. Der Weg dahin: 1 links,2 hoch,14 rechts,1 runter, 6 rechts,1 hoch. Hier JADE CARVING abgeben, aber >nichts< kaufen.

Danach nach Griechenland fahren (14 rechts,2 runter, 1 links) und EMERALD SCARAB (!) abgeben, >nichts< kaufen. Jetzt nach England (1 links,1 hoch,3 links) fahren und die 35mm CAMERA anbieten. >Nur< das BEATLES ALBUM kaufen. Nun zur naechsten Station nach San Francisco fahren (3 links, 2 runter, 12 links, 1 hoch, 1 rechts) und das BEATLES ALBUM abgeben.

Nun ist das Dokument vollstaendig und muss in Washington abgegeben werden (1 links,1 runter, 10 rechts, 2 hoch, 2 links,1 runter,3 links). Nun folgt ein Zeitungsbericht, das Spiel ist beendet.

Tastaturbelegung

U-Up :wenn der Roboter in
der Stadt ist
D-Down :wenn der Roboter auf
der Erdoberflaeche ist
M-Message :nur dann in Funktion,
wenn "MSG" blinkt
I-Infrared (1) :wenn vorher "U"
gedrueckt wurde und der Ort im grauen
Bereich liegt
C-Call :wenn vorher "U" und
ggf."I" gedrueckt wurde. Der Agent
erscheint dann

I-Inventory (2):wenn vorher "U",ggf.
"I" und "C" gedrueckt wurden. Nun
kann dem Agenten jedes Objekt
angeboten werden (RETURN)
Y-Yes :wenn vorher "U",
ggf."I" und "C" gedrueckt wurden und
der Agent einen Gegenstand angenommen
hat. ("Y" bewirkt Kaufen des
angebotenen Gegenstandes).
N-No :bewirkt das Gegenteil
von "Y" (nicht Kaufen des angebotenen
Gegenst.)
E-Evidence :nur ueberirdisch,
zeigt das vorhandene Dokument

PS: Codewort 2 (Ax-0310479) lautet
bei Commodore "Ax-0314479". Alle
anderen sind gleich. Es kann schon
mal vorkommen, dass der Agent seine
Wuensche aendert, z.B. in der Karibik
nicht die Camera, sondern Jade
Carving annimmt, dafuer aber in
England die Camera verlangt. Nicht
irritieren lassen, sondern einfach
weiterspielen...

7) Kleiner Schlusshinweis: Wenn man
das Spiel komplett geloest hat, wird
eine schoene Titelseite einer
Zeitung ausgedruckt. Hierzu muss aber
ein Drucker angeschlossen sein und
auf "On-Line" stehen. Wer keinen
Drucker am XL besitzt, hat halt Pech
gehabt...

Hi! Got a question, I just got ZAXXON on cassette, and I am having trouble loading it on my 130xe system. The instuctions say to hold down the START key, while pressing return on the keyboard. I have used both the Atari 1010 Recorder and the newer Atari XC12 recorder. Does Zaxxon only work on the Atari 400/800. Thanks! for the help!

Hold down OPTION and START and turn the computer on. Do not hold down
RETURN.
It should make regular tone sounds as it loads.
If it doesn't make the regular tone-space sound, then the tape is
questionable.
OPTION turns the built in BASIC off at boot time.
START tells the computer to load a tape. When you turn it on as described,
it should make a loud beep, at which time you hit PLAY on the tape. You may
have to position the tape a little into it for it to work. If there's too
long a delay before the data starts, the tape won't load/make the
beep-pause-beep sounds.

Oh, wait... I forgot the hit RETURN after the loud beep that occurs when turn on computer. You hit PLAY on the tape drive before turning the computer on, the tape won't start until you hit RETURN.

There are several emulators, actually. I'm not aware of one that is
called atari 800xl emulator, but I just try to answer for mine (atari++)

In the emulator menu, go to the menu "Os", the submenu "H1Dir". A file
requester will open and allow you to select a directory that becomes a
"virtual disk" for the emulator. Select for example your home directory.

Then, press "OK". The basic screen should re-appear. To save your
program, type

SAVE "H:MYPROG.BAS"

This will save your basic program into the directory you have just
selected, giving it the name "MYPROG.BAS". H: is the virtual disk you
have just assigned before.

Greetings,
Thomas

You gotta have loaded a DOS when you booted.
The two most common are FTe/Sparta and MyDOS.
Even the H: device Thomas mentions will still need a DOS loaded.
You have booted with BASIC enabled, so after you write your program, at the
READY prompt type:
SAVE "D:PROG.BAS"
where 'D:" is drive one (you can say "D2:xxx" for drive 2)
or "H:" for the virtual drive.
If you have run the emulator without a DOS, there is no way to save the
program to 'disk' (ATR image).

I don't see that. Even if you use SIO calls from assembler code done in
BASIC USR calls, you still don't have the D: handler to save it to a DOS
file. You're really way out here, not doubting you, the OP asked for a
simple answer. Where'd you get the DOS.SYS to dump to sectors on a disk?
Are you suggesting the sector dumps of OMNIMON? I'm sure you did it, but it
would take a lot more description of how to answer the question.

Not strictly accurate; it is possible (not easily) to peek in
page zero for program pointers and dump a block of
memory to a group of sectors with the resident disk
handler so you can reboot with DOS, reload the memory,
reset the pointers and then save it to a DOS file. I did it
years ago and it was a royal pain.

It really depends on the emulator. For atari++, the emulator comes with
its DOS
(no DOS.SYS needed), and H: and D: are always present. You can just fire
up the emulator and are ready to load and save files.

So long,
Thomas

I think you could save to resident cassette handler if the emulator
supports it but then I seem to recall you had to jump through a few
hoops to retrieve the program with DOS loaded.

Rick

Last-modified: July 22, 2007

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current, michael@mcurrent.name

This document is in a constant state of development and comes with no
guarantees. If you see any problems, I need to hear from you!

The latest version of this document is posted to these Usenet newsgroups
every 60 days:
comp.sys.atari.8bit, comp.answers, news.answers

Known mirrors of the the latest version of this document:
ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev
http://faqs.cs.uu.nl/na-dir/atari-8-bit/vendev.html

You may also request my latest working version at: michael@mcurrent.name

**********************************************************************
* For other 8-bit Atari related FAQs please see the "Welcome FAQ": *

* http://faqs.cs.uu.nl/na-dir/atari-8-bit/welcome.html *
**********************************************************************

UPDATES SINCE PREVIOUS POSTING:
2007.07.22 preamble updated with latest mirror sites info
2007.07.17 More Than Games: 850 to modem adapter (9 to 9),
EASI/O SPIDER Multi port adapter PCB
2007.07.15 updated: MatoSimi, including Belljumper 1k (game)
2007.07.01 added: Tomasz Piorek (Video Board XE project)
2007.06.19 MadTeam, MADS 1.7.7
2007.06.17 MadTeam, MADS 1.7.6
2007.06.16 Bostjan Gorisek, Sprite Engine 1.0.3
2007.05.25 Atarimax, SIO2PC/ProSystem Universal Interface -- USB edition
2007.05.25 updated: MadTeam
```

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Subject: A

4JAYS (Jay Colen) 9/04
519 W 4th St
Antioch CA 94509-1246
USA
Shop Phone: 925-777-1160
Store Hours: Tuesday thru Friday 12-6pm - Saturday 11-5pm
http://www.4jays.com/
Vendor: new and used hardware and commercial software

8-Bit Classics (Mr. Corey Koltz) 4/06
302 W Dewey St
Cassville WI 53806-9733
USA
Phone: 608-725-2137
http://www.8bitclassics.com/
Vendor: new and used hardware and commercial software

A-ONE Online Magazine 2/07
See: Dana P. Jacobson

ABBUC HAR -- Hannoverschen ABBUC Regionalgruppe 2/07
Hanover
Germany
http://www.bertelmann.org/har/
Vendor: XF351 Upgrade-Kit includes Floppy + Cable + EPROM + Bootdisc,
Used Atari 800 XL PAL, Speedy1050 TDS. Not all items online available--
Ask for more information. Additionally vendor of:
- all items from Frank Heuser Shop
- all items from Wolfram Fischer
Special lower prices for ABBUC members available.

ABBUC RAF -- Regionalgruppe ABBUC Frankfurt 5/07
Dillenburgerstrabe 61
60439 Frankfurt / Main
Germany
http://www.abbuc-raf.de/
Vendor: MultiJoy8 cable and adapter
Developer: SIO2PC, Network Interface, 2 computer interface (automatic
2 computer switch for use the same peripherie), Schaltnetzteil
(Power supply), 8 channel digital voltmeter, SIO2USB

Advantage Web Solutions & Computer Services (Jim Mason) 7/04
PO Box 561
Mason City IA 50402-0561
USA
http://www.jamess.com/
Developer: The Atari Weather Station -- build your own dedicated
temperature monitoring station using simple thermisters and the provided
software. Also available: source code listing, temperature data aggregation
utility

Alhart Enterprises Presents (AEP) 8/06
c/o Paul V. Alhart
524 N Z St
Lompoc CA 93436-5019
USA
tel: (805) 736-4624
"encoded" email: OOOp.alhartOOO@OOOverizonOOO.OOOnetOOO
Vendor: used hardware--mainly reconditioned disk drives: 810 (no case),
810 w/case, 810 w/Archiver, 1050, Rana 1000, 1050 w/doubler, Indus GT
Developer: AtariWriter+ Companion (disk), AtariWriter+ Companion II (disk),
StarStuffer (disk), Search System II (disk), Atari BASIC Enhancements (disk),
8-bit TTL Logic Analyzer (disk), MagicCalc (disk), Games disk:
Jacks Cargoship + Light Pen/(Light Gun) Tic-Tac-Toe (disk).
Publisher: RANA Repair Guide (book) - US$12
Repair shop: Atari disk drives

Altronic E.I.R.L. 6/04
Bolognesi 952
Bellavista
Callao 2
Peru
tel: (51)(1) 429-4298
Repair Shop.

Alltronics 8/05
PO Box 730
Morgan Hill CA 95038-0730
USA
Phone: 408.778.3868 Hours: 10am to 4pm Monday - Friday
Fax: 408.779.2608
http://www.alltronics.com/
Vendor: Atari CX85 Numerical Keypad, Blaster! Auto Fire Module,

TV/Computer Switch

Art Transfair Berlin (Andre Motzkus) 2/07
Brunsbuetteler Damm 223d
13581 Berlin
Germany
http://www.art-transfair.de/
Vendor: Computer, expansion, Floppy, memory-upgrades up to 16 mb,
Audio A/D changer, additional many other Atari items (16/32/64bit).
Special lower prices for ABBUC members.

Developer: ROMCRC-32 revision 1.0.2, Atari XL/XE Reverse Engineered Annotated ROM Listing, SID-LOAD 1.0.5, BINTRIM 1.0.1

James Catalano / Classic 8-Bit Atari / Artacyis Software 1/07
USA
http://www.geocities.com/TimesSquare/Arcade/8691/
Developer: Axe Dreadroom, Death Quest, Darkrealm Keep, Terror Below,
Anteater, Buried Treasure Hidden Death, Camp Killemoff, Chivalry,
Cliff Climber, Code Red Rescue, Defend the Donut, G-Man 1920, Graveyard,
Gun Slinger, Hopper, Incoming!, Monster From the Deep, Orccon, Pengy's Arctic
Adventure, Pin Pong, Seagull, Skulls, Snakepit, Spellbreaker, Splashdown,
Bioroid Battle, Knights of Battle, Line of Fire, Mine Sweeper, Sea Strike,
Sub Hunt, Rally XL, Swamp Rider, Turbo Trek, Airlord, Canyon Run, Tail Gunner,
Aliens: Genocide, Aliens: Search for Newt, Computer Virus, Lunar Miner,
The Mad Camper, Nightmirrors, Pipeworks, Rooms of Rondomm, Rotile,
3D Tic Tac Toe, Blackjack, Catapult, Champion Greyhound Racing, Demonix:
Battle of Souls, Gennetixx, Knock Out!, Particles, Ripley's Believe It Or Not,
Psybercom, Saucerian, Saucerian II, Shuttle Run, Star Rider, Starlord 5,
Stellar Rescue, Teleport

Gray Chang 2/05
USA
http://www.concentric.net/~ktchang/
Developer: Dog Daze, Claim Jumper, Dog Daze Deluxe, Bumpomov's Dogs

Classic Computer Magazine Archive (Kevin Savetz) 2/05
USA
http://www.atarimagazines.com/
Publisher: authorized digitized editions of: Antic (1982-1990), STart
(1986-1991), Creative Computing (1974-1985), Creative Computing Video &
Arcade Games (1983), Hi-Res (1983-1984), Compute! (1979-1994)

Computer Games Plus 3/04
PO Box 6144
Orange CA 92863-6144
USA
tel: (714) 639-8189
http://www.gamesplus.com/
Vendor: commercial software, plus a few power supplies

Computer Software Services (CSS) (Bob Puff) 4/07
1350 Buffalo Rd Ste 2
Rochester NY 14624-1829
USA
tel: (585) 429-5639
Fax: (585) 247-7158
http://www.nleaudio.com/css/
Vendor: hard drive systems (include a hard disk, Black Box, power supply,
controller, cables, and software), SIO cables, hard disk controllers:
Adaptec 4000 SCSI, Adaptec 4070 (RLL) SCSI, Xebec S1410a SASI
Developer: Black Box, Black Box with 64K Printer Buffer, Black Box Printer
Cable, Black Box Modem Cable, Floppy board, Super-E Burner,
Gang Super-E Burner, Multiplexer, Multiplexer Slave Unit, Quintopus,
Quintopus with Switchable Ports, Super Archiver, Super Archiver II,
Super Archiver --> SA II Upgrade, XF Single Drive Upgrade,

XF Single Drive Upgrade (without Drive Mech),
XF Dual Drive Upgrade, XL Dual Drive Upgrade (without Drive Mech),
XF551 Enhancer, XF Update, Ultra Speed Plus OS, Hard Drive Pro Backup,
Super Pill, Disk Cracker, Black Patch
Shareware developer: SuperUnArc 2.4, SuperArc 2.4, Disk Communicator 3.2,
MYDOS 4.50, BobTerm 1.21, MYDOS WHEREIS, MYDOS VTOC FIX
Repair Shop.

Cosine Systems (Exin [Sebastian], Intensity [Arman], Odie [Sean], 1/06
Sack [Adam], Magic Roundabout [Jason])
United Kingdom
http://www.cosine.org.uk/
Developer: demos: C.G.M. UKScene Radio Intro, 1K Party. game: Reaxion

Preston Crow 2/06
USA
http://www.crowcastle.net/preston/atari/
Developer: binload v2.5 (with Chad Wagner - Atari binary load format file
analyzer), atr2unix v1.2 (with Chad Wagner - Extract files from an Atari DOS
or MyDOS .ATR file), unix2atr v0.9 (Extract files from a Unix directory
tree and create a MyDOS ATR-format disk image file), dcmtoatr v1.4
(written by Chad Wagner), MyDos Binary Menu, SIO2Linux 2.0.1 (with Pavel
Machek - a rewrite of SIO2PC software for Linux), DISK 4.0 (sector editor
and more)

CSW-Verlag 2/07

Last-modified: July 22, 2007

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.
Atari, headquartered at the time in Sunnyvale, California, USA, produced this
line of computers from 1979-1992.

To see what Atari, Inc. is up to today, visit: http://www.atari.com/

ABOUT THIS DOCUMENT
Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current, michael@mcurrent.name

The latest version of this document is posted to these Usenet newsgroups
every 7 days:
comp.sys.atari.8bit, comp.answers, news.answers

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

Former (before 1987) Usenet newsgroups for Atari computer discussion:
net.micro.atari8 - created Feb 1986
net.micro.atari - created Nov 1982
net.micro - created Jan 1982

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

I was thinking of a real 8-bit rather than an emulator;
either way, it's a simple matter if you have cassette
to CSAVE or SAVE"C:" with no DOS loaded, then
reboot w/DOS and CLOAD or LOAD"C:" and put it
in a disk file. No hoops involved as BASIC and the OS
know where to find or store a program by the contents
of MEMLO, unless a very large program cannot co-
reside with DOS.SYS and the sector buffers.

Also a snap to use the SIO Resident Disk Handler (not
the CIO Disk File Handler) to manually write memory
to a series of sectors and record contents of 128-141.
The major hoops are involved after booting DOS and
reading in the sectors now offset above DOS and your
loader code with USR calls to fix 128-141 for the

relocated code,

Jess

nothing works. if there is another atari basic emulator i can load &
then save please
fill me in. i loaded a xf 2000 xformer from emulators, inc.

Richter emulator, no DOS required.
Get the win 32 zip file.
There's a manual at the page as well.
no ROMs needed.
http://www.romnation.net/srv/emulators/27/atari5200/Atari800Win-PLus-v3-1-fo
r-Windows.html
You have to get the ROMs for this version.
(ATARIXL.ROM ATARIOSB.ROM ATARIBAS.ROM) and put them in a ROMS directory.
Since you have XFORMER emulator, you have the
ROMs.

(I recommend 3.1 rather that 4.0)

Neither did that work, getting wrap.
you can get the site, just use the 'd/' on 20Old/ at the end
in the holmes 2/pc atari emulators Old/ directory.
at www.langesite.com/atari/holmes

You *will* need the BASIC rom (otherwise, no BASIC). You will not need
the Operating system ROM. Or, to be even more precise, you *should not*
use any operating system ROM if you want to use the built-in DOS. The
built-in Os of the emulator contains a filing system, the regular Atari
ROMs do not include one.

No matter what, the H: device is available in either version, but you
won't have any kind of command line ("DUP") to acces the directory, etc.
with the "real" ROM.

So long,
Thomas

Russg,

SIO is part of the ROM, so you can always write sectors to and from a disk
drive, even without a DOS. Of course, you need to be programming (poking
and peeking) at an assembly level basically, to do so. DOS.SYS just loads
the parts that understand files and the DOS file structures.

I think I understand that. It is a long shot to come up
with BASIC USR calls to do SIO sector read/writes.
I mean not easy stuff like the OP wanted.

thomas,
can you explain in simple language HOW i can SAVE or re LOAD the
program to my disk?
if i program.....10 print"leo"
20 goto 10
what is the exact next line i write to SAVE this?

1075. WriteATR

WriteATR writes the 5.25 disk as Atari Double Densityin PC drive, MSDOS can not read the disk. How does it read ? Can the real Atari 130XE computer hooked up to PC drive that can read Atari Double Density without Indus GT or US Double 1050? I have the SIO2PC/ProSystem for the serial port.

Thanks!
Jack

That's true! :) Way beyond what the guy wanted to know.

If you just want to access ATR files on your PC with the SIO2PC cable
you don't need WriteAtr, you need SIO2PC/Ape/AtariSIO or any other
Atari peripheral emulator.

WriteAtr is useful if you want to create real 5.25" (or 3.5") disks on
your PC and then use them in you Atari floppy drive. You don't need
to hook up your Atari to your PC with a SIO2PC cable in this case.

In most cases you need to have a double density capable disk drive on
your Atari and you also need double density ATR files.

If you are lucky and the floppy controller in your PC supports it
WriteAtr can also write disks in enhanced/medium density format
(1050 format 130k). This means every floppy drive (except the old
810 which only supports single density) can read the disks and
you can transfer every ATR file to a floppy disk - even single
density ATRs, just write them in enhanced density format, the
sectors 721-1040 will then be blank.

so long,

Hias

I'm guessing you want to make some Atari disks from
ATR images, to use with an Atari disk drive (1050, Indus, etc.)
If that's the case, use APE or SIO2PC and just sector copy the ATR image
from APE to floppy. Use a DOS
for this. MyDOS, FTeDOS. There's a copy whole disk in MyDOS. For FTeDOS
(SpartaDOS), boot the image, and at the D:> prompt type SCOPY D2: D1:
(assuming you have SCOPY). Or boot Disk Wizard II and use the Backup
feature, making sure your densities are set properly.

I'm guessing you want to copy some ATR images from APE/SIO2PC to a real
Atari floppy drive. If that is the case, use MyDOS duplicate disk, make
sure densities are set correctly. Or use Disk Wizard II backup feature. I
don't like FTeDOS SCOPY, but that might work also (SCOPY aborts if it has a
single bad sector.) If you have a double density ATR and only a single
density Atari drive, you can't do it. Set APE emulation to 'STUPID' and
ultraspeed to 'OFF'.
If I don't understand what you're trying to do, sorry.

Try one of these:

http://www.a800win.atari-area.prv.pl/ For Windows

http://www.math.tu-berlin.de/~thor/atari++/ The best

http://www.zerstoerung.de/download.html A8E read the install instructions

http://atari800.sourceforge.net/download.html mostly for DOS but will run
with any windows OS

http://www.emulators.com/download.htm but you already have this one

All require an ATR, XFD, DCM, blank or with an atari DOS. Recommended Dos
2.5 or MyDos 453
Read the documentation and help files, it does help.

KISS

IF you get a ready prompt:
10 ? "Hello World"
20 FOR I=1 TO 10:GOTO 10 :NEXT I

SAVE "D:WORLD.BAS"
LOAD "D:WORLD.BAS"
RUN "D:WORLD.BAS"

other PROGRAMING LANGUAGES might REQUIRE different, SAVE,LOAD,RUN syntax.
```

tried but this also does NOT work to save the program to disk
```

You need to be more descriptive.
What emulator are you trying?
Can you RUN your program, do you have BASIC?
Exactly what are you typing at the READY prompt?
What happens when you type that, any error messages
do you hang up?
Have you loaded any ATR images in the emulated disk drive? If so, what
image?
Are you booting with BASIC on and a DOS disk in D1:?
What happens when you boot, do you get a READY?
What happens when you type 'DOS' at the READY prompt?
What DOS are you using, or if none, I guess there should be a H: drive
enabled in Atari++?

Easy way to check if DOS is loaded is to type
DOS
and hit return.
If you get memo pad or self test or anything other then a DOS Menu of
some sort or command prompt, the emulator isn't finding the DOS disk.
Rick
